This attitude of the Russians caused me to make a stupid mistake one evening. It was after a dinner-party, and about eleven o'clock my friend invited me to come and pay a call with her. Personally I should have preferred English calling hours. I do not think one is at one's best at that hour after a fatiguing day, but such is Moscow fashion. We all went into the hall, which resembles a fur-shop, with all the furs hung round. Three servants of sorts, including her old maid—it takes three Russians to do one man's work—were helping her to put on her furs and snow-boots (though we were not going to walk an inch), and an old general, an exception to his race and class, who was of the party, and who hated the English so much that he had been barely civil to me—an attitude which I patently resented—to make amends came forward to help me on with my cloak. Having heard my hostess say '*Tak*,' or some such word, to her servants when they had aided her, I followed her example and, as I imagined, thanked the old man graciously by saying the same word. I saw a look of surprise on his face, and guessed that something was wrong, so in the carriage demanded an explanation. It appears that *Tak* is equivalent to 'That will do,' and is only the way you thank a servant in Russia. At present it is the fashion to say '*Merci*.' I am sorry, but after all I distinctly heard him say '*Angliaki*' (which means English) in a most offensive tone, and he was the only Russian I ever met who was not most courteous and kindly. But to return to our drive and our coachman, who had been a serf, he stopped of his own accord before the holy picture of Moscow in the little chapel or shrine of the Iberian Mother of God, which stands between the two archways that lead from the Kitai Gorod, or Chinese town, into the Red Place, on one side of the Kremlin. This is the spot to which the Czar, when he comes to Moscow, pays his first visit, and kneels bareheaded before the holy picture.

These holy pictures play an important part in the religious life of the Russians. They are carried to the houses of the faithful in cases of sickness, or on any other important occasion, for a sum of money. While I was in Moscow the daughter of a friend was betrothed, and the servants came to say that a holy picture was quite near; they had seen its carriage standing in the street, and might it come in and bless the pair? It is the peasants who keep the faith; the nobles are less pious. However, the picture was sent for, and from the window I watched

its arrival in a gilt coach, being carried by two priests. It was brought in and placed upright upon a table with candles, and some prayers were said.

It happened to be this very picture, a painting of no artistic value at all; but so much is it revered that when it is 'hired' a duplicate is slipped into its place, so that it may not be missed by the constant stream of worshippers at its shrine, and I wondered which picture I was looking at — not that it mattered to me, for the interesting thing was the shrine, with its splendid jewels and gold roof.

When we had admired the shrine, we got into the sledge again and drove round the Kitai Gorod, that part of the city encircled by a curious white wall, and presently turned into the boulevards, of which the inhabitants of Moscow are so proud, broader than those of Paris, or indeed any other European town. But what a contrast to the gay boulevards of Paris! Instead of the light-hearted, laughing Parisians in their brilliant toilettes, accompanied by trim cavaliers, who apparently have nothing else to do but pay them compliments, those grave, silent, dignified Russians enveloped in furs, driving in sledges the bells of which were the only cheerful sound to be heard as they slid over the deep snow. But it was not only the brightness of Paris and the bustle of London that one missed; it was the street cries, and above all the shrill cry of the newspaper boy or the hoarse voice of the 'extra special' hawker, hurrying along with the 'latest intelligence,' that one missed. There are no exciting 'extra specials' in Moscow, no specials at all—no newspaper men or boys that I ever saw; though there are two papers a day, I believe.

But it was not until we came to a level bit of road without much traffic, where our progress was less of a switchback nature, that, being accustomed to the crab-like movement of my off steed, and relieved from the immediate expectation of being pitched out of our sledge at the next turn or hillock in the street, I had leisure to notice the depression of Moscow streets. Tobogganning, by the way, is a favourite amusement, but I did not care about it, finding ordinary driving quite exciting enough. I should mention that this 'bumpiness' of the streets was the after-results of a thaw. Until then sledging had been smooth driving.

On this day, as has been said, the boulevards were deep in snow, and the gardens in the middle between the two broad roadways were deserted; but some weeks later, when the weather was warmer (that is, for Moscow, though in England we should call it winter weather) and the snow was partly melted and stood in huge heaps, sand had been carted into these gardens for the children to play with, looking so odd and yellow amid the snow; and groups of hardy little Moscovites, well wrapped up in fur hoods and tippets, were revelling in it, just as our street players do in some parts of London in the summer months, and then the boulevards took on a more cheerful appearance, though they still depressed me.

No doubt a knowledge of recent political events helped to sadden one, and one was reminded of Moscow's revolution of two years ago by the sight of the policemen in certain parts of the town standing with bayonets fixed or conducting an occasional prisoner through the streets—which, by the way, they could easily do in their prison-vans instead of marching them long distances through the town as they do.

But I was not allowed to dwell on these thoughts long, for now, as we turned a sharp corner, I involuntarily clutched at my friend, who in her turn grasped my hand as she said with a thrill in her voice and in accents of pardonable pride:

'Look! Look straight in front of you!'

We were dashing madly up an incline across a bridge over a sort of moat, which was planted with trees and shrubs. It was the moat of the Kremlin. I looked as desired in front of me, and saw that we were passing under a gateway into the Heart of Russia—the world-famed Kremlin. I had met my Russian friend some time before in Paris, and she it was who incited me to take this trip, and she had chosen the point of view best calculated to impress a foreigner at a first sight of her beloved Kremlin.

I was impressed.

Pictures of the Kremlin, with its battlemented, red brick walls, are familiar to almost every one, and it is well known that it is not a fort pure and simple but a fortified collection of buildings, including the Palace of the Czar, which he inhabits for his coronation, and six churches, one of them the little cathedral where the Czars are crowned, a much bejewelled and begilt church, and a great contrast to the church close beside it, where the Czars are buried in huge, hideous, box-like tombs.

The Palace of the Czar is a mixture of ancient barbaric splendour and modern lavish magnificence. I suppose the Hall of St George, in which the Czar holds his receptions, is the finest apartment, but in my memory dwell the old cramped rooms of former Czars, with their painted and mosaic walls and ceilings—among them the rooms which Napoleon occupied; and equally interesting the dining-hall in which the royal family dine alone on the occasion of the coronation, while the nobles, including the grand dukes, dine in a long balcony overlooking the dining-hall. The carpet here, a corner of which was uncovered for me to see, was unique and made by hand, of cloth-white ground—if I remember right—with brown, blue, and other cloths appliquéd on to it in conventional patterns by the nuns in some convent.

The public are not allowed to go into this apartment (and I was admitted only because my companion was an official well known at court), a fact of which I was not aware until, stooping down to

examine the carpet—which I greatly admired, and, truth to say, had a desire to copy for a rug—I was aware of a murmur in the background, and looking round, saw at the barrier we had passed a crowd of Russian peasants and sight-seers, who were not pleased to see the carpet which their 'little Father' the Czar had trodden upon on this sacred occasion, and which had been uncovered for us to see, touched by a foreigner. Needless to say, I hastily withdrew my sacrilegious fingers, sorry to have hurt the feelings of the loyal, loving Moujiks, and abandoned the idea of reproducing anything so beautiful.

To 'do' the Kremlin requires more than one afternoon, so we did not attempt it; but after looking into the two chief churches and the nunnery, we crossed over to the monument erected to one of the Alexanders, which overlooks the river just within the walls. I regret not to be able to give any historical details of this fine structure, gorgeous and gilded with true Russian lavishness, nor even to be able to say with certainty to the memory of which Czar it was erected; but the fact is, the monument consisted of a statue surrounded by three sides of a square of arcades, roofed inside with mosaics, giving a picture of all the Czars from the first Romanoff, with their names and dates.

My friend was a Russian of the Russians, and devoted to her country and her Czars, but a little consideration will show the reader that to see these Czars, read their names and dates, and hear their histories requires a turning up of one's face which causes a painful crick in the neck; and a little more consideration will cause the writer to be forgiven for issuing from those arcades after a miserable half-hour with a complete indifference to all the Czars, their dates or names, and only conscious of feeling very cold and mentally and physically worn out.

The coachman, who had been careering about over the snowy space, seeing us, swept up to us in fine style. My companion paused before she gave further orders, and cast a loving glance at the buildings of the Kremlin; then, mindful of my dislike to sight-seeing in general, proposed that we should just drive once round inside the Kremlin, passing the 'Great Bell' as it stood where it had fallen from the tower close by, the Czar of Cannons, and farther on the spot, marked by a cross, where the Grand Duke Serge was blown up by a bomb, and out at the famous 'Redeemer Gate,' through which every man, whether he be Russian or foreigner, must pass bareheaded.

It is said that Napoleon was the only man who ever broke this law with impunity, and even he, tradition says, had his hat blown off as he tried to pass through with his head covered. Last year, I was told, a daring American did try to ignore the signs made to him to uncover, and was promptly made to kneel and bow to the holy picture forty times. Whether this be true or not, it is certain that no one would be allowed to pass by hat on head unpunished.

Our coachman having satisfactorily uncovered and crossed himself, we passed out into the Red Place, where so many executions have taken place, and at the end of it we came upon the quaintest little church ever built or conceived by mortal eye. This was the Church or Cathedral of St Basil, which remains to amuse, delight, or torment the eye of man in spite of Napoleon's order to 'take away that mosque.'

This is the church to describe which travellers have exhausted all the similes and abuse possible. Hare calls it a nightmare, and another writer likens it to 'a stranded, jelly-like polyp of many colours, which has thrust itself out into knobs and excrescences, a most extraordinary mass of little terraces, galleries, pinnacles, small steeples, onion-like domes, pagodas, and Gothic windows in colours of red, green, lilac, yellow, blue, and other shades hardly to be found in the rainbow.'

This is not by any means all that this writer had to say upon the subject of that little church, but as I grew very much attached to it—so much so that it was called 'my church' by my friends—I will not repeat the rest of his abuse. All that I will say is, that if it is eccentric outside, it is still more eccentric inside. I once went in with a member of a consulate, who remarked that he took visitors of his nationality to see that church so often that he thought it must be his thousandth visit. I promptly asked his help to describe it in a letter home.

'Impossible,' he cried, shrugging his shoulders; 'one could never conceive such an edifice unless one had seen it; but you might say that it is of many colours and shapes, and that there are all sorts of nooks and crannies inside, and—that, in short, it is impossible to describe it, but you will send a picture post-card.'

This was his most brilliant suggestion, and not so brilliant as the post-card, which gave no idea of the real colouring or architecture. The reason I liked that church was simply that when I lost myself in Moscow and saw it, I knew at once where I was; there was no mistaking it; it was unique, and it is something to be unique.

After seeing this church we both felt that we had had enough of sight-seeing for that day at least, and the order was accordingly given to return to my friend's home; and so bitterly cold was it, now that the sun had disappeared behind a cloud—a snow-cloud—that I cared nothing for the reckless driving of our coachman, to whom collisions seemed a necessary evil, so long as we were hastening to warmth and tea, even though it was tea Russian fashion, without milk and with slices of lemon floating in it, and very weak.

One ceremony which I witnessed impressed me greatly; it was the funeral of a public man. The ceremony in the church lasted four and a half weary hours. I should certainly not have lasted it

out if I had not been with a Russian, who, being used to these lengthy religious services, stayed to the bitter end, quite unaware that it was more than I had expected, and that I was not used to a church without seats, where one has to stand or kneel all the time. However, now that it is a thing of the past and the fatigue forgotten, I am glad that we did wait; though I was somewhat taken aback when, thinking we were related to the deceased owing to our being in mourning, they made a way for us, and we found ourselves near the uncovered coffin, where the dead man lay in his official dress, with all his orders pinned on a white satin cushion at his feet. It was startling, and must be very trying for the relations; but the most trying moment is when the Farewell of the departed is chanted, a most touching and marvellous lament, which stirs one even though one does not understand the words, which are very beautiful.

After this the relatives and friends give their last embrace, and the coffin is covered and taken to the cemetery, where another service is gone through. I did not attend that, having 'stood' as much as I could.

Such are life and death in Moscow as I saw them, and it seemed to me that the former was perhaps the sadder.

Of their politics I know little and care less, but for the Russians I care much. A kindly, hospitable, people, with large brains, large hearts, and high ideals, they have no more sincere well-wisher than the writer that they may speedily and bloodlessly work out their own salvation.

PEDRO THE MULETEER.

CHAPTER III.

IT was the sight of a grazing horse against the dusky skyline that showed the muleteer where to find the fugitive. The mottled roan was feeding unconcernedly on the rich grass, and a little distance from him, plainly to be seen as The Wolf galloped on, a patch of white showed on the ground. Pedro had searched for long hours, for he knew that her fleeing instinct would be to climb, as it is the instinct of a lost child. The road that passed his mother's cottage was the only hilly road in the whole republic.

She was lying in a tumbled heap on a rocky ledge, and her dark hair clothed her as with a garment. Her dress was disordered and bore unmistakable traces of its hasty donning; but Pedro had eyes for none of these facts. He was bewildered at the heaving sobs that shook the slender figure. She never lifted her head as The Wolf's hoofs rang on the rocky soil at her side; she only sobbed heart-rendingly, her head waving helplessly on her small, white hands. Pedro leaped to the ground and stooped over her.

'*Señora!*' he murmured helplessly, possessed with a wild desire to bid her thrust her woe on him that he might bear it for her sake; and then again, '*Señora!*' She lifted her face for one moment, and a gleam of hope shot through the swollen eyes. Then blank despair took its place when she saw that the man who bent over her, though like her husband, was not he.

'Juan, Juan,' she sobbed piteously, 'come back to me!'

Pedro uncovered his head before her awful grief. He had never seen the beautiful face save when it was sparkling with happiness or tender with wonderful pity. Now he was more than half-afraid. He put one great hand on the tumultuously heaving shoulder, and his voice was very grave as he said, '*Excellenzia*, let me share the pain.'

'My husband,' she cried with a choking throat—'what have they done with him?'

Pedro was silent. How could he tell her that the man she loved was to die with the dawn? She raised herself on one hand and looked at him earnestly. She must have read his message in his face, for she threw herself down again and gave free rein to her passionate grief.

'He was too brave to flee from them—cowards!' she cried after a while. 'Now they will kill him like a dog. Unfit to lick the dust from his feet though they are, they will kill him, my Juan!'

'He may be saved,' said the muleteer helplessly, though he had not the faintest glimmer of light in his simple understanding.

She heard the words, and looked up again. 'You have heard, then?' she asked sharply.

'He is to die with the dawn, *Excellenzia*,' said Pedro deprecatingly, holding out his hands, with a helpless quiver of his face.

She looked once more, as though to read his inner soul, and then sprang to her feet. 'You lie!' she screamed furiously. 'Pah! you are a coward like the rest. I tell you, you man, that he is too brave to die. Who are you who dare come to me with such a tale?'

'I am Pedro the Muleteer, *Excellenzia*,' he said humbly—'he whom thou didst tend in the past time. It is but too true. I heard it in the city; I saw him sentenced to death. I would have attempted a rescue, but I was one and they were many. It would have meant him no good, and they would have shot him then.'

She realised the utter hopelessness of the situation now, and she wept no more. Pedro shrank back from her staring eyes and pallid face.

'Take me to him,' she whispered intensely. 'I will die with him; he must not die alone. He sent me away, knowing that this was coming; and, like a coward, I fled. But I will go back to him. I tell you I will go back.'

Then she tottered and stretched out her hands blindly. Pedro caught the swaying form and laid it tenderly on the hard ground. She moaned a little; but as the muleteer, as reverently as though in the presence of the angels themselves, placed one arm under the drooping head, her eyes fluttered a little, opened wide, and then shut tight. After that she did not move.

He picked her up in his giant arms with the ease of his strength, and looked vaguely about him. It was some distance to his mother's hut, but that was the only shelter to be found. He went towards The Wolf, and climbed laboriously into the saddle, still bearing his precious burden; and then, riding furiously, yet shielding her in his arms from the rough motion, he brought her home. She never moved, not even when he dismounted and carried her in to his mother.

'Water, Pedro *mio*, and wine. Haste, then, my son. The pretty one faints merely. So, she will recover.' The long lashes were already quivering on the white cheeks, but there was no further movement.

'*Por Dios*,' said the old woman, with a grimace, 'thou mightest be His Excellency himself, Pedro, bearing the *señora* in thy arms thus. *Teuf!* it is a romance.'

Gradually the germs of an idea that had been floating through the muleteer's brain during the ride home began to take clearer outline. All people he met were commenting on his likeness to the ex-President; he knew himself that he might have been his brother. And there on the rough couch, her breath coming in tiny flutters, lay the one to whom the man he resembled was dearer than life. 'It is well,' he said, and lifted his head with a new pride. What a man could do should be done to bring back the light to the shrouded eyes. His mother had gone from the room in search of some simple remedy, and the night had fallen fast. There was no light in the place now, save from the smouldering brazier on the floor; but by that light Pedro stooped and pressed his lips to the white forehead with grave reverence. Then he went out and caught The Wolf.

CHAPTER IV.

THE WOLF was sorely wearied, for he had done a good day's work already, but he made no demur when Pedro threw on his heavy saddle. Down the hilly road they clattered, and the earth seemed to turn itself to welcome the coming dawn as they raced on. With whip and spur Pedro urged on his beast, but it was within an hour of dawn when he reached the centre of the city. All was very quiet. With the sublime carelessness of their race, the victors in the previous day's *débâcle* had not posted any guards in the streets; and the only sound to be heard was the distant clamour of some drunken mob bent on pillage. Corpses still strewed the streets, and The Wolf stumbled once and nearly fell over a dead woman who clutched a dead babe in her arms. In another hour all this quietness would be changed. The prison doors would be thrown open and the yelling mob would press upon the escort's heels as the prisoner was led forth to die. But there was still an hour before that time, and in an hour much might be done.

It had penetrated to Pedro's understanding that by some means or other he must gain access to the prison. He rode there, but his heart fell utterly as he marked the strength of the guard about the doors. Manuello's trusted lieutenant, a scoundrel unalloyed, was in command of the guard, and him Pedro knew there was no hope of outwitting. To gain entry by the door was impossible, but there were other ways. Your true Spaniard does not always use the doors; he prefers the windows in most cases.

He dismounted from The Wolf, and approached one of the sentries.

'He dies with the dawn, then?' he said with an assumption of rollicking anticipation. 'Might one stand close here, that one may see the tyrant led forth?'

The sentry growled forth a sulky acquiescence, and Pedro searched under his coat. There was a pleasant gurgle as he drew forth his hand.

'It is a good brew,' said the sentry, smacking his lips. 'Nay, nay, I will leave thee a little.' But he drank it all notwithstanding, and after a furtive glance at the officer of the guard, who dozed in an arm-chair on the prison steps, he grew garrulous.

'He will assuredly die with the dawn,' he said. 'There will be no sport, for he will not cry out. *Bang, bang*, and it is all over.'

'But if he escapes?' asked Pedro with a motive.

'He will not escape. He is in the condemned cell, and no man escapes thence.'

The muleteer's heart gave a great leap of thankfulness. The condemned cell was at the remotest corner of the prison—he knew that well—and its only window faced on a narrow street that was seldom traversed. The prison authorities of Puerto Bianca trusted to the strength of the great iron bars to retain their prisoners for death.

'On second thoughts,' said Pedro carelessly, 'I will find a warmer waiting-place. *Adios!*' He vanished into the night, and the soldier yawned miserably. But Pedro was wide awake as he led The Wolf carefully round to the back of the prison. No one was in sight. Stooping, he muffled the

mule's hoofs in his rent shirt, and then led the animal close under the barred window that stood high up in the frowning wall. Then he mounted the saddle and rose to his feet. He could see into the cell, but could distinguish nothing.

He was surprised at the ease of the task. One great shoulder he inserted between the bars in the centre, and he thrust his hand between his coat and the rough iron. Then he began to exert his utmost strength, a strength that was more than trebled by his devotion to the white woman in the hills. He strained until the great sweat-drops coursed down his face; he wrenched and thrust, feeling the stout bars bend beneath his attack, until the knotted muscles on his arms cracked like to break. One other tremendous heave he gave, and the bars bent outward like straws. Then he thrust himself through the aperture, and groped about him in the darkness.

'What is that?' asked a voice from beneath.

'It is I, Pedro,' he answered thickly, spitting the blood from his mouth. He had broken something in his chest with that last great effort. A surprised murmur reached his ears, but he waited no longer. He forced his way right through the window and dropped on the hard floor.

'It is Her Excellency,' he explained in choking gasps, as a strong hand was placed on his shoulder. 'She weeps all the day, and looks her fears. She is up on the hills in my mother's hut, Excellency.'

The ex-President laughed bitterly. 'You have not come here to tell me this alone?' he said. 'Do the men of Puerto Bianca torture their victims, then?'

'No, no, it is not that, *señor*. She calls upon your name without ceasing, and she is very ill. I have come to save you.'

He felt the surprised start the ex-President gave, but the time was flying fast.

'It will be a jest to these people, *señor*,' he said hurriedly. 'I will take your place here in the cell—I am very like you in the face—Pedro the Muleteer, whom Her Excellency was kind to. You will climb through the window where is a hole, and will take The Wolf, who stands in the street outside. He will take you to her; trust him—he knows the road.'

Pedro was deaf to all protestations. The ex-President would not hear of such a quixotic sacrifice, and protested that he would stay and meet his fate like a man. Pedro was in despair, but his worship of the fair girl gave him an added cunning.

'Then I stay here, *señor*. There will be two men shot if we are found together. But if you go I will tell them the jest, and they will not harm Pedro—who always means well.' He was lying very freely now, for he well knew the blind fanaticism of an angry mob.

Then, as a further plea, Pedro drew a simple picture of the hopeless anguish of the girl in the hills. In few words and with useless gestures (for the cell was still as dark as the grave) he outlined her incoherent sobbings and drew a gloomy prophecy of her ultimate fate supposing her husband died. Then he felt for his companion, and began to unbutton the uniform coat Balcazia still wore.

In his tremendous grasp the ex-President was as helpless as a child. In less than five minutes the two men had changed clothes, and Pedro lifted the man in his arms to thrust him through the aperture.

'Leave it to The Wolf,' he said as he lowered Balcazia to the street. Still protesting, the surprised man groped his way to the mule and mounted. Straining his ears hard, Pedro heard the sound of the animal's muffled feet, and then he fell back from the window, half-senseless.

But the need for action came upon him. If the guard came and found the ruined window the deception would be made manifest at once, and his sacrifice would be all in vain. He groped about the small cell until he encountered a rough bench fastened to the wall. One wrench, and another, and the bench was free. He reared it against the wall and climbed upon it; then, with his last remnants of strength, he wrenched the bars back into their place. There was a dull ache in his chest, and his breath was coming in painful gasps, but his heart was light. He had repaid the debt he owed the fair woman whom he worshipped as a man might worship a star. So that when the dawn filtered through the window and the tramp of marching feet resounded in the corridor outside, he threw his head back and smiled.

'Come forth, Balcazia,' said the commander of the guard. 'It is time.'

'I am ready,' Pedro said proudly, and with folded arms and shining eyes he followed them forth.

A man in the stained dress of a muleteer heard the rattle of rifle-firing from afar, and he sobbed aloud.

THE END.

SPANISH INNS.

By CHARLES EDWARDES.

THERE is all the difference in the world between a Spanish country inn and a Spanish town hotel. Even in A.D. 1908 Don Quixote would feel much at home in the average *posada* of the Castiles and Asturias miles from a railway. The same pig-skins of wine are in their cellars, the same blackened rafters in the common guest-room, the same jangling of mule-bells outside, and the same costumes and oaths are on the muleteers and their tongues. The electric lamps in certain of them would puzzle him until he decided, as he assuredly would if he had time to think it out, that they were the work of witchcraft and the devil, and therefore something to smash. But the merry dances, as of old, by the firelight in that great common kitchen, to the clacking of castanets or the tinkle of a guitar, might keep his noble frenzy in abeyance until he fell asleep on the floor like the rest of the company, with his sad head on his saddle-bag and his *monta* for a blanket.

The town hotels (*fondas*) are tame in comparison. They give you soft beds and good, if rather oleaginous, fare, but no company worth mention, and very conventional circumstances. They bloom in the sunlight of regular hours: dinner at twelve or so, and supper at seven or eight, notified in print. These hours, in the smaller towns, are very irregularly kept; but the distressed waiter will always blame the kitchen for that. They have also regular guests, all bagmen. This soon palls on the stranger in search of human types as well as scenery, adventures, and good wine. I have met no commercial traveller so silent and unattractive as the Spaniard. In so far as his personality impinges upon that of the stranger, he is nothing but a hungry animal. He and his brethren pace the dining-room for the half-hour previous to the prescribed time for the dishing of the soup, and the subsequent other half-hour or so, with grunts and growls of exasperation which increase with the movement of the clock's minute-hand. The long-suffering waiter comes and goes, apologising pathetically for the customary delay, and flicking at the flies with a duster; but he cannot soothe them. Even when all is ready and they are invited to fall to, they do not become genial like our own knights of the road. They croak now about the bad cookery. Their table-manners are often worse than the cookery. I have seen one eat in his hat next to another in his shirt-sleeves. Interpret this aright, and you will understand that, in spite of the sacrifice of their independence to the restraints of a commercial life, they are as proud of their birthright as any other Spaniard, and withal wholly careless about the feelings of their neighbours, notwithstanding the formal courtesies with which they sit and rise. I may be wrong, but I have often fancied that upon such occasions the Spanish 'commercial' eyes an Englishman with special disfavour as one who may be a rival in cottons or hardware. He has an old-fashioned belief, fostered by certain of his country's old-fashioned newspapers, that the Briton is still a demon at trade, pursuing it under all manner of disguises.

This kind of company gives no glamour to the life indoors at a Spanish inn. There is not even much chance of an outrageous bill. In certain provinces the tariffs are a matter of municipal arrangement. You find in your bedroom an intimation from the worshipful mayor of the town that under no pretext need you pay more than five pesetas a day for board and lodgings. It is agreeable news in its way, but it seems to make you and the maids and men who wait on you rather more like machines than is altogether desirable. The *muchacha* who brings you your chocolate in the morning is the only person who smiles on you. She comes in, however, without knocking, as if you were as insensitive as the bedstead; and of course she has thus caught too many men in their pyjamas, or less, to blush as well as smile at your own individual degree of dishevelment.

You are welcomed or not, as may happen, at these town hotels; but at the mellow *posadas* of the large villages which sleep all day in the sunshine and only rouse when their corporate flocks and herds come home in the short gloaming, you will be wise to expect no welcome at all. The landlord understands the mulemen and the bruised and fatigued old ladies and gentlemen whom the diligences discharge upon him in twos and threes by moonlight. They are not critical customers, and he knows just what to do with them. But a solitary foreigner is another pair of shoes; and if he is very anxious about his lodging he had better begin humbly with the large-paunched, imposing person in the flowered waistcoat and the immense sombrero whom the startled maid brings to him as her master. Like as not this gentleman will at once make excuses. He has nothing in the larder and no bedroom fit to be seen. But assure him you wish to take pot-luck, that the house must not disturb itself on your account, and that you will consider it a profound favour to be received on such—or indeed any—terms, and all may be well. Then it will perhaps be your privilege to be made free of the vast, flea-bitten establishment and the merry

smiles and capers of the black-eyed little hussies who swarm about it.

Even after this, until he feels quite at home with you, the gentleman may show little regard for your feelings. Allured by the gleam of glass, the bright fruits, and the flowers in his parlour—poor parlour, but the gala chamber of the house none the less—you enter the room and sit at your ease. But this display of magnificence is not for you. It is a saint's day, and mine host is expecting company of his own. The company arrives in a covered van while you are still stretching your legs and enjoying the perfume of the flowers; and in a moment or two they fill the room—peasant ladies with silk handkerchiefs round their sleek, black heads, and much jewellery, and enormous, broad-shouldered men like the landlord. Without even an apology, this last points you straight to the door. You in your broadcloth or tweeds will do very well in the kitchen, he gives you to understand, and to the kitchen you go.

Here, amid noisome flies and nasty fumes, there is company enough of another kind—cooks, maids, children, dogs, cats, and smaller creatures. But it is your own fault now if you do not get fed somehow, if your patience and courage do but hold out. I know nothing more murderous of appetite than to be a forced witness of the preparations for a meal in a downright orthodox old Spanish *posada*. There is the chase of the toughest of the roosters in the adjacent sand-patch; a chase punctuated by the shrill and—to the modest stranger who understands them—very surprising blasphemies of the cook, knife in hand, resentful of the aged victim's agility in its last moments. There are the subsequent proceedings from feathering onwards; there is the chopping of bread for the soup with the same knife that beheaded the fowl, the smearing of grease—— But why continue? This land, so fertile in proverbs, has one germane to the situation: '*Quien las cosas mucho apura no vive vida segura*' ('He who looks too closely into things has but a sorry time of it').

By-and-by, having finished their own meal in the parlour, the rustics troop into the kitchen as a wider field for their vinous hilarity, and spread themselves about with fine pictorial effect. If, as is probable, they have a baby among them, it will be tossed into the air. Heated arguments arise between the men, and differences of opinion about the baby between the women. The words '*Conio!*' and '*Hombre!*' ring through their phrases. And the more contemplative of the company range themselves in front of the stranger's lowly table (the swing back of a venerable bench), and while they pick their teeth divert themselves with his idiosyncrasies much like a thoughtful solitary schoolboy before the monkey-house in Regent's Park. This, of course, is the stranger's opportunity. If he have the precious gift of adapting himself to circumstances, he may in a minute or two win the goodwill of these massive peasants, who face life fearlessly and care not for lords nor ladies. A smile for the dames, a pinch of praise for the child in arms, and an uplifted glass with a nod for the men, and you are near enough to the open sesame of their simple hearts. The mere words 'It is a bad Government,' tossed at random, may introduce you intimately to their sympathies. Praise the wine to the landlord's face and the trick is done completely. 'Why, he is just the same as ourselves!' one of them will exclaim in a burst of delight. More than possibly, the landlord's sledge-hammer hand now falls hard on your shoulder as he formally initiates you into his friendship with a '*Viva!*' And when the bottle of negrohead rum is brought forth from the many-coloured chestnut-wood coffer in his bedroom, to be distributed in very tiny glasses to the other ladies and gentlemen, you are not forgotten. Nor will you on your part forget the '*Hombre!*' of indignation which strangles your proposal that you pay for your tiny share of the rum as if it were an indulgence of your own commanding.

The nights are the most trying part of the entertainment in such a house, especially if it be at a cross-road corner; not so much because of the fleas as because of the constant racket outside. Wagon after wagon, each with its six or eight mules, comes grinding to its haven under the stars, with the music of bells and shouts which tell of the wine the men have quaffed on the way. There are also the little rat-trap diligences from remote mud-villages, bound for the nearest railway station and its first train in the morning. They shake their passengers together to and from the ruts and holes in the road like dice in a box, so that often human nature can stand no more of it, and the exhausted souls stagger forth at 2 A.M. or so, and lie down in the vast stable among the mules, horses, and men already supposed to be asleep. The village *sereno* or watchman is not so violent a nuisance, but even he makes against repose as he strolls under the window now and then, and drowsily proclaims the hour and the state of the weather.

There is as much going as coming in the night. The man in charge of a mere donkey-cart and a large barrel of wine may suddenly decide that he has reposed sufficiently. He has slept for an hour or two with his head on his animal's buttock and its tail fondly curled round his thick red neck. That, with his midday *siesta* under a fig-tree, while his animal fights the flies, will do very well for him; and, being aroused by new-comers, he likes the look of the stars outside. So up he gets, shakes himself, drags out his reluctant ass, and harnesses it for the road. The ass relieves its feelings with a bray as loud as a church organ, the muleteer silences the ass with a crack of his whip like a gunshot, and more wheel-creaking begins. So it goes on until the dawn, when the brown-and-blue pigs of the

house and all its poultry start a tumult of their own. They rush and trip about the corridors, and even burst such bedchamber doors as have not sound latches to restrain them. This is the time for the stranger to rise, call for his chocolate, pay his trifle, and wish his landlord an enthusiastic 'farewell.' The landlord's responsive, 'Go with God, *caballero!*' will, however, be matter-of-fact, and perhaps in a tone which makes you think he means rather, 'Go to the devil!'

The unseasoned tourist whom such treatment may irritate had better confine himself to the cosmopolitan hotels of the tourist towns. Had Shenstone travelled in Spain he would have hesitated ere writing that stanza about 'life's dull round' and the 'warmest welcome at an inn.' The average rural *posada* in the Peninsula is pretty much like this. There are variations from the type, of course, but experience will readily find a reason for the anomaly. It is either a new master, young, from a real town, and with what are called American ideas; or it is a lately imposed tax which has startled the old innkeeper into the discovery that he has nothing in his purse to meet it, and that, therefore, he must endeavour (once in a way) to profit by this manna in the wilderness in the shape of a stranger who has descended upon him from the clouds; or it is something else not so easy to describe. There is another proverb in the country, '*Ventera hermosa mal para la bolsa*,' which may be translated, 'A handsome landlady is bad for the pocket.' In other words, unless you pay your hostess all the compliments her face demands she will endeavour to give you emotions in the morning—with the bill. At least, I am willing to read no deeper into the text than this.

One need not rummage far back into the centuries for the causes which conspire to make the Spanish innkeeper so impressive and even haughty a personage. This land of sierras and blistering, dust-haunted plateaux has for generations bred folks with a rare conceit of themselves. Though tyrannised by his officials (from postmen to Secretaries of State) like no other people, he is at heart the most convinced democrat in the world. His king is only the first gentleman in a country where all are gentlemen except the Gallegos of Galicia, those contemptible worms who enjoy work for work's sake, and save money on it, too! The local pride of birth is immeasurable. An Asturian will tell you gravely that he is descended from one of Pelayo's men—that untiring three hundred who slew three hundred thousand Moors in the great fight for independence which started Spain afresh in its career as a Christian kingdom. A Basque points to the imposing stone escutcheon over his front door in evidence of *his* ancestral greatness. There may be a dung-heap before the door, but there is nearly sure to be that pompous stone shield over it, with or without the Guernica oak-tree in one of its quarterings. As for the Castilian, he must be assumed to be as brave as the Cid, as generous as Andrew Carnegie, as patriotic as Romana or Palafox, as amiable as he is brave, and as wealthy as he is generous. He is the best of them all in Spain, and if you behave to him as if you realise his many virtues of character and blood you will have no cause for complaint about his favours in requital. Thackeray has left us an amusing, if rather indelicate, sketch of Louis the Fourteenth in contrasted presentments as Rex—Ludovicus Rex—and mere bald and half-stripped, spindle-legged Ludovicus. The Castilian in full ceremonial panoply and as common man is something kin to that. Humour him in his monstrous self-esteem and you make him more than enough your friend. Though he die of suffocation from the flattering phrases you thrust down his throat, he will return you compliment for compliment, and with his last breath declare that he is no better than yourself, and that he passes away contented in having met you. A hundred years ago the French tried to win the Castilian's regard by hanging his relations on his own threshold and insulting his wife and daughters. It was Bonaparte's most serious tactical error in the Peninsula, and he paid for it. When poor in everything else, the Castilian is still rich in pride and the furious valour which bursts helmeted and armed from the wounds in his self-esteem. It is just because Wellington and the other British officers in command of the allied army omitted to flatter him, but told him plain truths about himself instead, that he is still far from mindful of the service we did his nation in fighting its battles.

But to return more closely to my subject. All Spain's country inns are not under such autocratic control as this of my sketch. In some of the poorest I have had charming entertainment at next to no cost. At Lubian, a miserable hamlet high in the mountains between Galicia and the Traz-os-Montes province of Portugal, I expected bad times. The house was a black, two-storied hovel, but it devoted itself to my needs with most gracious determination. The village was scoured for an orange to follow the bread-soup and omelette which was the best menu to be managed. The wine was almost undrinkable, but the orange was served on a lace napkin, and the little daughter of the house who waited on me rejoiced in its size. 'Never have I seen such an orange, *caballero*,' she declared. 'You will perhaps remember Lubian for it when you are again in your own country.' Upstairs I shared the one large bedroom of the house with I know not how many others, screened from them by curtain slips hung from the rafters. It was amusing, until I slept, to listen to their various snores. But by-and-by I woke in the moonlight, and beheld a slender, barefooted shape in white patrolling the uncurtained length of the room with a babe in her arms. 'Who is that?' I asked. The reply came softly from the little daughter of the house: 'Do not discompose your-

self, *caballero*. Sleep on. It is only I. The *angelita* is restless, and so I walk with her. But I will be very quiet.' The moonlight on the girl's face while she whispered is my best memory of Lubian, not its mammoth orange.

Cangas de Onis, in Asturias, has left a different impression. I came here on a fair-day, and the great barrack of an inn was crammed with tipsy and consequential *proprietarios*. The dinner was a banquet. There were dishes of fine trout, the *puchero* was perfection, the cherries were like little apples, and the wine was from a famous valley. Nevertheless, I got but little to eat, because I preferred not to scuffle for it in the local way. The heated maids had no time to sympathise with me and my lack of enterprise, and my fellow-guests thought only of themselves. Some smoked cigars between the courses, half of them wore their hats, and all were more interesting than the look of the dinner itself. Better still, they were exquisitely heedless of the presence of a stranger. I was thumped on the back two or three times by my neighbours with an invitation to 'Drink, friend!' and that too was very well in its way. And I spent the night with two of these raucous fellows in a room none too large for one.

A last vignette and I have done. Hospitality is not one of the Spaniard's strong points, and so the conduct of a certain young gentleman of Ginzo, in Galicia, seems worthy of mention. The Spaniard will often effusively offer you everything in the world, yet be astonished if you take him at his word to the extent of anything worth mention. This young gentleman of Ginzo was, therefore, a marked exception to his race. My supper was to be ready at eight, and at about half-past nine I sat down to it with him for my companion. He was, it appeared, affianced to the innkeeper's daughter, a calm-eyed girl who would have been beautiful but for the powder on her face. She waited upon us, and early in the meal the young man astonished me by the freedom with which he clasped her waist and held her when she brought the plates. 'She is mine, *señor*, when the time comes,' he explained more than once. Nor did she deny it.

As it chanced, I did not like the local wine, and said so. The young man took my objection much to heart. He called for other wines at his own expense. 'You will offend me, word of a gentleman!' he declared when I protested. 'I have a rich father, and it is a pleasure to me.' He appealed to his sweetheart to confirm his words, and I let things go. They went capitally as touching the new wine, but his conduct to his young lady did not improve. He kissed her now again and again, and after the sweets took her on his knees. But this was the last straw. With tears of rage streaking her powder, the *señorita* slapped his face violently and rushed from the room. Instead of bringing him to his senses, this treatment made him only the more determined to lavish his generosity upon me. He called for the landlord, and soon a dozen bottles of liqueurs were before us. I know not how many of them he tried, but two were enough for me; and eventually I left him. When I went to bed he was still with the bottles, too far gone for arguments to work upon. Nor was it any affair of mine to discuss him and his character with his future father-in-law. In the morning, however, when I had drunk my chocolate and was for the road, I mentioned him to the landlord. 'Bah!' cried the man, with a fine gesture, 'never will I give my daughter to such an one! He has done for himself, *señor*. I who speak swear it! To disgrace me and my house in that way before a stranger! And the girl is of the same opinion!' That sounded very bad. But as I rode away across Ginzo's wide plain for the mountains of Orense I had my doubts. In a village like Ginzo a rich young fool must have considerable value as a husband. Obviously it was his head rather than his heart that was at fault; and the innkeeper and his daughter might wisely put their own heads together to relieve him of its responsibilities in the future.

THE YEAR'S PRIME.

By leafy hedgerows, where the birds are silent,
Where whispering winds are breathing soft and low,
I seem to hear the 'farewells' of the summer
Breathed by the laden bees that murmuring go.

The scent of death arises from the grasses,
From all the weeds so closely twined and spann'd;
Weeds that in summertide were flowery masses,
Decking the lonely places of the land.

But all the specks of faint decay now glowing
On shrub and tree and on the humblest flower,
A tender peace to weary hearts is showing,
A hint of rest for our receding hour.

As fades the grass the days of man are speeding,
As grew the grass he grew to strength and glow;
And who would toil for ever in the struggle
Of crowds that hurry, pressing to and fro?

These last bright hours in tones of peace are closing;
The last pale flowers, the latest buds in bloom,
Wake softened anthems that, distrust composing,
Disarm the fears of dying and the tomb.

Each season has its beauty: springtime sprightly,
The full-robed summer with its dower of pride;
And last, not least, this death that falls so lightly,
Crimson and orange, like an Eastern bride!

THE PRIME MINISTER'S PATRONAGE.

By MICHAEL MACDONAGH.

ONE of the most difficult and embarrassing duties of a Prime Minister must be the distribution of the patronage, civil and ecclesiastical—the bestowal of titles and decorations, the appointments to bishoprics and deaneries—which lies in his gift, subject to the approval of the Sovereign. This brings him closely into contact with the sordid side of public life.

Lord Brougham, in his *Statesmen of the Time of George III.*, writing, as he says, of his own official experience in the years when greedy place-hunters crowded round him as Lord Chancellor, declares: 'No one who has been long the dispenser of patronage among large bodies of his fellow-citizens can fail to see infinitely more numerous instances of sordid, selfish, greedy, and ungrateful conduct than of the virtues to which such hateful qualities stand opposed.' Richard Brinsley Sheridan is another witness to the meanness of politicians. In one of his great speeches in the House of Commons on the French Revolution, he ascribed the desertion of Fox by some of the Whigs to Pitt's lavish distribution of offices and honours. He said that this dirty traffic in lucre and emolument tended to confirm the pernicious doctrine 'that all public men are impostors, and that every politician has his price.' Then he went on in a scathing blast of satire: 'Nay, even from those who seem to have no direct object of offices or profit, what is the language which the actors speak? The Throne is in danger! We will support the Throne; but let us share the smiles of royalty. The order of nobility is in danger. "I will fight for nobility," says the viscount, "but my zeal would be much greater if I was made an earl." "Rouse all the marquis within me," exclaims the earl, "and the peerage never turned forth a more undaunted champion in its cause than I shall prove." "Stain my green ribbon blue," cries the illustrious knight, "and the fountain of honour will have a fast and faithful servant."'

If this repulsive picture of the demoralisation of politics was ever true—which I am disposed to doubt—it certainly is not true of the twentieth century. There probably is a good deal of selfishness in public life. Some politicians are influenced less by a sense of duty to the State than by the hope of reward. No doubt there is scheming and intriguing for the honours, places, dignities, preferments, stars, and ribbons which the Prime Minister has at his disposal. But the manifestation of human nature in public life cannot be so bad as it is depicted by the disappointed and cynical Brougham and by the ardent party man Sheridan, eager to score a point against his opponents. At any rate it is the comic aspect of this pursuit of the Prime Minister for offices and distinctions, so far as it is selfish and unworthy, that appears most conspicuously in the records of political history.

Happily the place-hunter, the claimant for a step higher in the peerage, and the seeker after ribbons and stars often meet with well-merited rebuffs. Pitt was induced by Sir John Sinclair to constitute a Board of Agriculture towards the end of the eighteenth century, and make him the President. Having enjoyed his office for a few years, Sinclair began to desire promotion in the social scale. 'Dear Mr Pitt,' he wrote to the Prime Minister, 'don't you think the President of the Board of Agriculture should be a peer?' 'Dear Sir John Sinclair,' replied Pitt, 'I entirely agree with you. I have, therefore, appointed Lord Somerville to succeed you as President of the Board of Agriculture.' Sir John Sinclair went about wringing his hands and exclaiming, 'Dear me, dear me! it was such a wilful misunderstanding.'

Lord Melbourne was indifferent to honours or distinctions for himself. The young Queen Victoria, anxious to show in some public way her high appreciation of the great services of her first Prime Minister, pressed him to accept the much-coveted decoration of the Garter. He declined the honour. 'Why should we waste the resources of the Government?' said he good-humouredly. 'A Garter may attach to us somebody of consequence whom nothing

 [*All Rights Reserved.*]

else will reach. But what would be the use of my taking it? I cannot bribe myself.' The undecorated coat of Castlereagh at the Congress of Vienna in 1814 distinguished the Foreign Secretary of England in that gorgeously attired assembly of ambassadors. Similarly, the plain and unadorned costume of Melbourne, the Prime Minister, made him conspicuous in the crowd, glittering with stars and ribbons, at Court functions. It has been said that his vanity found a certain gratification in conferring honours upon men of nobler birth than himself. On the contrary, the authentic accounts we have of him in connection with the dispensation of patronage show that he had little sympathy with the craving for titles, and derived no pleasure in satisfying it. In the distribution of honours at the Coronation of Queen Victoria he seems to have been guided principally by party considerations. Here is a letter he wrote to Lord Lansdowne in June 1838 with respect to conferring peerages upon supporters of the Government in the House of Commons:

'I think it absolutely necessary not to vacate counties or towns at the present moment. I would, therefore, boldly lay down as a rule founded upon the necessity of the circumstances that we should make few members of the House of Commons peers. It follows from this that we must have a very limited creation, as it must be remembered that the claims of those who are in Parliament will be considered hereafter. I propose, therefore, to make only eight. English: Hanbury-Tracy, William Ponsonby, Sir John Wrottesley, Paul Methuen; Irish: Lissmore, Rosmore, Carew; Scotch: Kintore. I think if we adhere strictly to this we can stand upon it, and shall produce the least dissatisfaction, which is all that can be expected. The only promotions, Mulgrave to be a Marquis and Dundas to be an Earl. I am very desirous that the whole should be limited, as these large creations at Coronations are, I believe, quite unprecedented, and date no further back than the Coronation of George IV., who was overwhelmed with promises. If no Members of Parliament are made, the whole may be discontented, but no particular person can be. I hope that you may think this is the safest course that can be pursued in a difficult conjuncture. I send you John Russell's view of it, which is very much mine. All the Scotch agree that Kintore is the only Scotch peer we have who has fortune for it.'

The petty annoyances which usually follow the distribution of honours is illustrated by the following extract from a letter from Melbourne to Lansdowne on June 27, 1838, after the publication of the Coronation List:

'I have this morning received Lord Queensberry's resignation of the Lieutenancy of the County of Dumfries, upon the ground of Lord Kintore being made a peer whilst he is passed over.'

A peer who was an old friend of Melbourne called on the Prime Minister previous to the Coronation to urge that his long fidelity to the Whig Party deserved some recognition. 'Well, what can I do for you?' asked the Prime Minister. 'I don't care about it myself,' said the Baron; 'but my lady wishes that I should be an earl.' Melbourne, who knew that his friend was hardly rich enough to maintain an earldom, exclaimed, 'Why, you are not such a damned fool as that, are you?' A peer, who was already a knight of 'the Most Noble Order of the Garter,' but whose ambition was still unsatisfied—'a fellow,' as Melbourne described him, who was asking for everything, and fit for nothing'—wrote to the Prime Minister for an interview. 'What the devil would he have now?' said the worried dispenser of patronage. 'Does he want a Garter for the other leg?' A Scotch peer who was manœuvring for a decoration got a mutual friend to sing his praises in the ear of the Prime Minister. 'It won't do,' cried Melbourne. 'If I gave —— the Thistle he'd eat it.' Poor Melbourne, indeed, found it impossible for some time before the Coronation of Queen Victoria to escape from the hunters after titles and decorations. He had contracted the habit of talking to himself aloud, and one day, as he stood alone in the hall of Brooks's Club, divesting himself of his overcoat, he was heard to exclaim, 'I'll be hanged if I'll do it for you, my lord!' No doubt in imagination he was still being pursued by an importunate claimant for a higher rank in the peerage.

What was incorrectly said of Lord Melbourne, that his vanity found a vent in the distribution of titles, seems to have been true, to some extent at least, of Gladstone. Lord Morley in his *Life of Gladstone* writes: 'Once in a conversation with Mr Gladstone I asked him whether he remembered Peel's phrase to Cobden about the odious power that patronage confers. He replied, "I never felt that when I was Prime Minister. It came in the day's work like the rest. I don't recall that I ever felt plagued by improper applications. Peel was perhaps a little overfond of talking of the sacrifices of office. A man has no business to lay himself out for being a Prime Minister, or to place himself in the way of it, unless he is prepared to take all the incidents of the post, whether disagreeable or not. I have no sympathy with talk of that kind."' Lord Morley adds: 'He was far from the mind of a Carteret. "What is it to me," said that glittering Minister, "who is a judge or who is a bishop? It is my business to make kings and emperors, and to maintain the balance of Europe." To the bestowal of honours he brought the same diligent care as to branches of public business that to men of Peel's type seemed worthier of care.' Sir Edward Hamilton, who was Gladstone's private secretary, also declared that his chief found 'a pleasurable excitement in proffering a Lord Lieutenancy or a peerage, an order or a baronetcy.'

Having been four times Prime Minister during an aggregate period of twelve and a half years, Gladstone had ample opportunities of indulging

in this form of excitement. Like Melbourne, he would never accept an honour for himself; but he created sixty-seven new peerages; on his recommendation fourteen Scotch and Irish lords, who were not peers of the realm, were called to the House of Lords; he was also responsible for seven promotions in the peerage—one dukedom, two marquisates, one earldom, and three viscountcies; and the baronetcies created on his recommendation were ninety-seven. Gladstone must have had many applications, direct and indirect, for honours which he felt bound to refuse. That, no doubt, has been the experience of all Prime Ministers. There is a good story told of the way in which Disraeli got rid of an importunate applicant for a baronetcy upon whom, for sufficient reasons, it was impossible to confer the honour. 'You know I cannot give you a baronetcy,' said Disraeli; 'but you can tell your friends I offered you a baronetcy, and that you refused it. That's far better.'

In the *Life of Lord Randolph Churchill* there are some amusing letters from Lord Salisbury which make further contributions to the comical side of the subject. Churchill, when leader of the House of Commons, wanted some honours for his supporters. The Prime Minister writes: 'I am afraid that in the matter of honours I am as destitute as you are. The C.B.'s are all exhausted.' Again Lord Salisbury says: 'My Baths are all run dry.'

Titles, decorations, and distinctions are, of course, legitimate objects of ambition, and if their distribution appears at times capricious, narrow, or unwarranted, they have been on the whole worthily bestowed for eminent services to the State in all walks of life. John Leech, in a famous *Punch* cartoon published in 1851, represented the Prime Minister, Lord John Russell, as a little boy writing 'No Popery' on the wall, and then running away. It was a satirically amusing illustration of Russell's precipitate action in passing an Act prohibiting the assumption of English territorial titles by the newly constituted Roman Catholic hierarchy, and then irresolutely declining to put its provisions into force. 'That was very severe, and did my Government a great deal of harm,' said Russell, talking of the cartoon to a friend years after; 'but I was so convinced that it was not maliciously meant that I sent for Leech and asked what I could do for him. He said he should like a nomination for his son to the Charterhouse, and I gave it to him. That is how I used my patronage.'

Every Prime Minister has also the bestowal of considerable ecclesiastical patronage. Lord Salisbury had to appoint to almost every bishopric during the years he was Prime Minister, and to some of them more than once. He is said to have been known in ecclesiastical circles by the most appropriate name of 'the bishop-maker.' There is a story told of a dean of St Patrick's, Dublin, named Packingham, who wrote to Wellington, his brother-in-law, at the time he was Prime Minister: 'My dear Duke, one word from you will get me the vacant bishopric;' and received the following laconic reply: 'My dear Dean, not a single word.' But we have had an interesting confession from Gladstone on the subject of Church preferments which shows that the sense of duty, not the hope of reward, is the distinguishing note of dignitaries of the Church. 'It has been my lot,' said he to the Honourable Mrs Goodhart in 1889, 'to dispose of some fifty preferments in the Church—high preferments, I mean, such as bishoprics and deaneries. Not one of the men I have appointed has ever asked me for anything. That is the literal and absolute fact; and I do not know that anything could be more honourable to the Church of England as a body.' 'I am a very lucky man—luckier than most Ministers. I have no sons, grandsons, or nephews to stuff into the Church,' said Lord Palmerston cynically enough. During the years he filled the office of Prime Minister he had twenty-five mitres at his disposal, and, like all Premiers—so far as we can gather from the biographies of statesmen—he was uninfluenced in his appointments by political motives. 'If a man is a good man, I do not care what his political opinions are,' he said to Lord Shaftesbury. 'Certainly I had rather not name a bishop who would make party speeches and attacks on the Government in the House of Lords; but, short of that, let him do what he likes.'

Dr Magee, who died Archbishop of York, applied to Disraeli in 1868 for an appointment. At that time he was Dean of the Chapel Royal, Dublin, and wishing to get to England, he wrote to the Prime Minister asking for any minor vacancy that might be created by the filling up of the Deanery of St Paul's. Disraeli perpetrated a droll joke at Magee's expense. He began his reply so that on one page of the letter the words appeared: 'Very Reverend Sir, I regret that I cannot comply with your request;' while upon turning over the leaf Magee read the reason: 'I felt it my duty to recommend Her Majesty to nominate you, if agreeable to yourself, to the vacant See of Peterborough.' This was a jest which Eldon, the Lord Chancellor, had indulged in years before. Dr Fisher of Charterhouse applied to him for one of the Crown livings to which the Lord Chancellor has the right of presentation. He replied: 'Dear Fisher, I cannot to-day give you the preferment for which you ask.—I remain, your sincere friend, ELDON.' Then came the injunction, 'Turn over,' and on the next page Fisher read: 'I gave it to you yesterday.'

Queen Victoria exercised a strong personal influence and control over the appointments to the Archbishopric of Canterbury. When Dr Sumner died, in 1862, Lord Palmerston nominated Dr Baring, Bishop of Durham, for the Primacy; but the Queen insisted on appointing Dr Longley, then Archbishop of York. On the death of Archbishop Longley in 1868, the Queen's selection was the Bishop of London, Dr Tait, setting aside

Disraeli's nominee, Bishop Ellicott of Gloucester and Bristol. Bishop Wilberforce records in his diary a conversation with Dean Wellesley on the subject. The Dean told him: 'Disraeli recommended Ellicott for Canterbury. The Queen would not have him; then Disraeli agreed most reluctantly, and with passion, to Tait.' It is hardly credible, however, that that supreme courtier, Disraeli, could have been put into a passion by anything the Queen might do.

George III. once adopted a more decisive way, even, of filling up a vacancy in the Archbishopric of Canterbury. On January 19, 1805, Dr Manners-Sutton, Bishop of Norwich, was giving a dinner-party in his Windsor deanery, when his butler informed him that a gentleman wished particularly to see him, but would not give his name. 'Well, I can't come now in the middle of dinner,' said the Bishop. 'Beg pardon, my lord, but the gentleman is very anxious to see you on important business;' and the butler was so urgent that the Bishop apologised to his company and went out. The gentleman who would not be denied proved to be King George III. 'How d'ye do, my lord?' said he. 'Come to tell you that you're Archbishop of Canterbury—Archbishop of Canterbury. D'ye accept—accept? Eh, eh?' The Bishop bowed low in token of acceptance. 'All right,' said His Majesty. 'You've got a party—see all their hats here. Go back to them. Good-night! good-night!' Next morning Pitt appeared at Windsor Castle to inform His Majesty that Archbishop Moore had died the day before, and to recommend the Bishop of Lincoln, Dr Pretyman, for the vacant primacy. 'Very sorry; very sorry indeed, Pitt,' said the king, 'but I offered it to the Bishop of Norwich last night, and he accepted. Can't break my word.' Pitt, according to Lord Sidmouth's account given afterwards to Dean Milman, was very angry; but the deed was done, as the king meant it should be, and so Dr Manners-Sutton became Archbishop of Canterbury, and held the great office for twenty-three eventful years.

So far as I have been able to ascertain, there is recorded but one attempt to bribe a Prime Minister. In November 1802 a man named Hamlyn was indicted in the Court of King's Bench for offering a bribe to Henry Addington, the Prime Minister. The Premier should have two thousand pounds if he procured for the prisoner the office of landing surveyor at Plymouth. Hamlyn was sentenced to three months' imprisonment and a fine of one hundred pounds. Addington must have felt that the niggardliness of Hamlyn added injury to his insult. Two thousand pounds! What a paltry sum to offer the man who makes kings and emperors!

CONTRABAND—BY THE 'GOLDEN CRESCENT.'

By Commander E. Hamilton Currey, R.N.

'SHAWIA, Beni-Snassen, Riff, Berber, Jew, Turk, infidel, or heretic, it's all the same to me, Grub, and I presume that it's all the same to you, provided the *duros* come in?' Captain Ralph Heriot, of the mercantile marine, took his cigar out of his mouth and stared fixedly at Mr Moses Gruber, in whose office at 1000A Cannon Street the interview was taking place.

Mr Gruber, who was pondering over a map of Morocco spread out before him, tapped thoughtfully on the edge of his desk with a finely pointed pencil, and puffed heavily at his cigar; from outside came the subdued roar of the City traffic, and a pale winter sun filtered in through the dirty window-panes. There was a pause of some moments, and then Mr Gruber spoke: 'If we don't take over the contract, captain, there are plenty of others who will.'

Heriot sat up in his chair with some show of excitement. 'Look here, it's no time for fooling. The Germans or the Belgians will take it for a cert', and, mind you, I'm by no means saying that those chaps at Marseilles even would sniff at it; but we have a pull, because we ain't quite so greedy as the others, and provide better stuff.'

'It's rifles this time,' observed Gruber slowly.

'Yes,' replied the other quickly, 'and ammunition—as much of it as we can land. Mighty little boggling and haggling over the price either, supposing it's got out there quickly.'

'Whom did you see on the coast, and where did you see him?' asked Gruber.

'Sort of half-bred German chap, who calls himself Holstein, who's been scull-dragging around the Moghreb-al-Aksa for years; all the bashaws from Tangier to Marrakesh know him, and most of the tribal sheikhs from Udjda to the Atlas. I think the French would hang him out of hand if they could catch him; but he's not the sort of bird who'll spread out his tail for them to put salt on. He came in to Saffi with Hafid's crowd.'

'It's Hafid's crowd, then, that we are supplying?'

'That I don't know, and, what's more, I don't care; but here at any rate are the papers he gave me to prove that he wasn't a stumer and could put up the brass if we could provide the arms.'

For some time both men bent over and examined the documents which Heriot produced from a large envelope; the sailor giving swift, pregnant explanation here and there; the man of business keen and alert, assenting, disputing, examining.

What the outward and ostensible business of Moses was those who dealt with him never stopped

to inquire. One thing they knew as a certainty, that where arms or ammunition were wanted in any quarter of the globe, the firm of Volsass, Schmidt, & Gruber could supply them with a certainty and a secrecy equalled by few, if any, of their Continental rivals. There have always been men who fish in the troubled waters of the world, and find therein a rich reward for the difficulties and dangers inseparable from such an occupation.

At length the colloquy was ended. Moses Gruber swept the papers together and crammed them into their envelope, which he handed back to Heriot. 'Right,' he said; 'they put up half the money in London *pro rata*, the rest to be paid on delivery. My firm is for it. When can you sail?'

'I'm just out of dock with a clean bottom, and completed with coal yesterday, so it's just as soon as the stuff can be got aboard.'

. . . . . .

The *Golden Crescent* was steaming down Channel; she had dropped her pilot, and was slipping along at ten-point-five knots per hour, her normal gait of going. All along her upper deck, ranged in orderly rows, were bags of coal; every crevice and cranny that could hold an extra bag had been utilised, as until her cargo was disposed of Captain Heriot had no wish for communication with any port whatsoever. A light but bitterly cold wind was blowing up Channel, but not sufficient to raise any sea; astern, in the gathering dusk, shone the glare of that tremendous light on Saint Catherine's Point. Heriot was pacing the bridge with the mate, an old and tried comrade; they paid wages in the *Golden Crescent* fully commensurate with risks taken, and the same trusty crowd 'signed on' for voyage after voyage, keeping their mouths shut in a most surprising manner when ashore in London and elsewhere. Nobody but an idiot wishes to spoil his own livelihood, and Captain Heriot shared Solomon's dislike of a fool to the fullest extent.

'French and Spaniards,' Heriot was saying, 'will be on the lookout, not for us in particular, but for any one in general. The Spaniards don't count, but if some of these blessed Frenchmen get any wind of this they may shepherd us down the coast, so I ain't taking any risks; once we take our departure from Ushant, we don't sight any land until we run in to meet our dear friend Holstein on the coast. The mischief of it is that now the men-of-war on the station have got mighty little to do since the scrapping has moved inland from Casablanca.'

They caught the tail-end of a westerly gale after rounding Ushant, and experienced to the full the delights of a heavy beam-sea on a ship with a deck-load of coal; but twenty-four hours saw an end of it, and as the good ship reeled off the knots to the southward the sun rose on cloudless days, the moon shone on cloudless nights, and the spirits of all on board rose.

'Looks like a spell of fine weather, sir,' said Thompson, the mate, to Heriot, returning his sextant to its case after taking a meridian altitude at noon.

'Yes,' replied his captain, 'it does; and heaven send that it lasts! *We* know the coast in bad weather, and a spell of that at this time of year might ruin the trip.'

They kept well out to sea until the ship had made her southing, and they had reached the latitude 'somewhere to the southward of Saffi,' as Heriot told the mate, in which the spot on the coast arranged between Heriot and Herr Holstein was situated; then the helm was shifted, and they stood in due east. So far all had gone well; they had sighted no ships save on the farthest horizon; but the anxious time was still to come. The wind was now ahead and light—that is to say, easterly and off the coast, which was what suited them exactly, as with a full head of steam they made their way in; but the luck was too good to last, and out of a misty horizon there swept belts of fog. Heriot, fuming with vexation, never left the bridge as they surged through a calm sea, now blanketed down by a fog impenetrable as wool, again emerging into bright sunlight and a cloudless sky. At length, in one of these emergings, the lookout on the forecastle-head sang out sharply, 'Sail on the port bow.'

Heriot clapped his splendid Zeiss glasses to his eyes and stared long and fixedly; then he said slowly to the anxious mate, who was standing at his side, 'A French destroyer, by all that's unlucky, Thompson.' As he said it he saw black smoke leap from the funnels of the destroyer, and in another moment she was, in Thompson's phrase, 'travelling like a train.'

Escape was impossible, and the *Golden Crescent* was held on her course, the hands staring over the rail at the rapidly approaching Frenchman. In a quarter of an hour she ranged alongside, torpedo-tubes and guns shrouded in their tarpaulin envelopes, a bland and smiling officer, a miracle among Frenchmen, speaking perfect English, interrogating the captain. There was an interchange of question and answer, conducted with demonstrably false politeness and charged with much mendacity. The admiral on the station had heard that gun-running on an extensive scale was about to take place, and the smiling officer was desolated to inconvenience the captain, but his orders were to board and examine papers. Would the captain be so good as to stop and allow him to come on board?

The vessels were running side by side as the conversation took place, a gentle, undulating swell of some size, coming up from the southward, causing them to roll considerably. Heriot smilingly assented to the proposition of the French officer that the latter should come on board, saying that he would just turn his ship's head up to the swell for greater convenience in boarding. This he did, stopping the *Golden Crescent* quite close to the destroyer, the keels of the two vessels being thus at right angles to one another.

The Frenchmen busied themselves in getting a dingy over the side, and Heriot stepped to the voice-tube down to the engine-room: 'Is Mr

MacPhail below?' 'Ay, ay, sir!' 'Is that you, MacPhail?' 'It is, captain.' 'Stand by to give her every ounce of steam when I signal go astern. Work your engines for all they're worth.' 'Right you are, sir.'

The French captain stepped into his dingy and shoved off, and as he did so Heriot jammed the telegraph to full speed astern. The destroyer's crew, idly watching, never noticed what was happening until too late; then a sub-lieutenant put her telegraph over to full speed ahead; but as he did so the stern of the *Golden Crescent* on the downward fall of the swell crashed into her stern, crumpling up her starboard-quarter like an eggshell, bending her starboard screw-shaft, and stripping two blades off her starboard propeller. Heriot stopped his engines, reversed his helm, and went full speed ahead, circling round the destroyer, the amazed captain of which vessel sat petrified in his dingy as he watched this audacious steamer—which bore no name or mark by which he could identify her—steam swiftly away, leaving him to creep cautiously back to Casablanca half-speed, with one engine.

'I hope friend Holstein ain't going to keep us waiting on the coast, Thompson,' said Heriot with a grin. 'It's one battleship and four armoured cruisers, to say nothing of all the torpedo craft on the station, will have an urgent desire to pay us a morning call after this turn out.'

'Oh Lord!' said Thompson, laughing, 'did you catch a sight of the French skipper's face as he sat in the dingy. I wouldn't have missed it for a month's pay.'

As he spoke the scream of a twelve-pounder shell was heard passing overhead; but next moment the fog shut down upon them again, and Heriot remarked quietly that they might go on bombarding, but without doing much harm. Another hour passed, and gradually, with a light wind from the northward, the fog split up and finally disappeared, enabling Heriot and Thompson to get afternoon observations of the sun, and thus fix their longitude exactly.

'At ten knots we ought just to hit it off at daylight,' said the former as they bent over the chart; and at daylight, as he prognosticated, the coast, long and low, came in sight.

'"Two dark conical hills half a mile inland; on the top of the southernmost you will see a staff with a white flag. When you sight the flag keep it east by north, and run in to ten fathoms, then anchor." Those are the directions of friend Holstein,' said Heriot.

And as they approached the coast all hands strained their eyes for a sight of the conical hills and for the sovereign promised by their captain for the first man to sight the flag. They made an astonishing land fall; an eagle-eyed A.B. spotted the flag at the same moment as Heriot picked it up with his glasses, and in an hour's time the anchor was let go some four hundred yards from the shore, and the work of transference began. It was toil of the most frantic description, as surprise by a French warship on the station meant confiscation and annihilation. Heriot told the story of the encounter with the destroyer to Holstein, who—garbed in turban, *jellab*, and yellow Moorish slippers—offered scarcely any points of difference from the tribesmen by whom he was surrounded.

'There is but one God,' quoted the German piously, 'and I trust that Mohammed is going to look after his true believers this time; just one hour before you hove in sight the French cruiser *Gueydon* passed northwards, going about fifteen knots; but my crowd here were not to be seen, and those on board suspected nothing. She may look in at Saffi, but she's bound to Casablanca, after having thoroughly searched the coast and found nothing. So we sha'n't be bothered with her again.'

'That, then, is a little bit of all right. And now, Herr Holstein, regarding payment—dollars, you promised, in portable cases. Are they here?'

'They are not,' replied Holstein coolly.

'Then, my friend,' returned Heriot calmly, 'I shall just take back the rifles and ammunition already landed, and get back to London river with all convenient speed.'

'*Ach Gott*, Herr Captain!' grunted the German, 'don't be a fool. The money I have got, but it is not here.'

'Where is it, then?'

'A day's march back into the country. I could not get all the camels I wanted. I had to travel fast, and so I leave the dollars to journey faster. They are now hidden. As soon as I get back to where they are I put down the arms there, load up the camels, and come back here.'

Heriot whistled. 'And you expect me to believe that yarn?'

'Listen, and I shall tell you the truth. You cannot stop landing the arms now, because I have but to say one word and you and all your men they have their throats cut, and my army here would loot your ship and burn her afterwards.'

'That,' commented Heriot grimly, 'I can quite believe.'

'But,' continued Holstein, 'I am not such a fool; and once I play that trick, although I get this cargo for nothing, I should never get another; and I make my money in North Africa, captain, where I know the language and the people, and they know me. You think this one silly what-you-call yarn?'

'I do,' snapped Heriot.

'All the same,' continued the German, who had lighted a large china-bowled pipe and was smoking placidly, 'what I say is true. The arms, mine friend, I must have, even if these so-excellent soldiers have to cut all your throats; but the dollars will be here in two days after the last camel-load shall start from here.'

'I shall come with you and fetch them,' replied Heriot. He was well aware that he was completely in the power of this cosmopolitan adventurer, and had nothing to guide him as to whether or no he was speaking the truth; but to see the thing through to the bitter end, at the cost of his life if necessary, was characteristic of the man.

'You have got me a sitter, my good friend,' he said to Holstein; 'and whether you are an honest man or a most almighty scoundrel you and Allah alone are aware. As I don't want my throat cut—yet—the arms shall be landed. Then I ride with you to find the dollars which pay for them. If they are not there, Herr Holstein, I give you fair warning that I shall see to it you never make another contract.'

Holstein remained profoundly unaffected by this harangue, smoking his big pipe and occasionally shouting guttural directions to the hurrying tribesmen loading the grunting, growling camels.

'If you do not find the dollars, captain, you shall to me what you like do,' he replied stolidly.

Heriot stared at him for a time fixedly, as though trying to gauge his truthfulness—or the reverse—and then said, 'I must give orders about the ship, as I intend to go with you.'

'Ver good,' was the impassive reply.

Heriot jumped into the first empty boat returning to the *Golden Crescent*, and straightway informed Thompson of the situation. Some nautical language concerning the artfulness of Dutchmen may be omitted with some profit, but in the end Heriot handed over charge of the ship to Thompson, who was to make a good offing from the coast, then wait and return to the anchorage at the expiration of forty-eight hours from the time that the caravan started from the coast. Six hours more and the cargo was all on the beach, and at the expiration of a further two Heriot, with a heavy revolver stuffed into his pocket, rode slowly inland at the side of Herr Holstein and at the tail of a string of slithering, smelling camels.

Holstein, on a three-cornered, wiry, long-tailed barb, still puffing at his apparently inexhaustible pipe, rode by his side, silent, enigmatical.

Heriot broke the silence. 'Whose territory are we in?' he asked.

'That of the Sultan of Morocco, mine friend.'

'Yes, of course; but which Sultan, Abdul Aziz or Mulai-Hafid?'

'This is the Bled-el-Makhzen, or the land of the Sultan. Here they fight for Hafid.'

'And you?'

'I do not fight. I trade.'

'But if the other crowd come down upon us?'

'We must defend ourselves. The *Mahalla*, or army, for which these arms are intended, lies three days' march beyond where we are going.'

'Shall we be attacked?'

'Who knows? They range far, the light horsemen of these plains.'

All night the camels padded and shuffled over the hard sand, and the mounted escort, rifle in hand, rode hard by on either side. The moon came out, flooding the plain with silvery light; occasionally a hare scuttled distractedly to right or left, or an owl hooted in the distance. Save for this, there was silence. As the gray dawn crept into the sky ahead the caravan halted, watered their animals, drank themselves, and snatched an unsatisfactory meal on bread, gritty and of a consistency like leather.

As Heriot lit his pipe and dozed in the loose sand by the side of the water-hole Holstein approached him. 'It is nearly six o'clock,' he said. 'By one in the afternoon we reach the cave in the hills where the boxes are stored—Spanish dollars from Marrakesh, Herr Captain. You will find the tally quite correct.'

'I have counted your crowd, Holstein,' replied Heriot, 'and I make it out at just about two hundred. How many are waiting out there at the back of beyond?'

'Ten times the number. They wait the arrival of the Ouled-Sali tribe from the south, then they move.'

'With the cargo of the *Golden Crescent* in their hands,' laughed Heriot; 'but I see that we are getting a move on us.'

About 10 A.M. low hills came in sight to the eastward; and, pointing to one in the middle, a little higher than the rest, Holstein said, 'At the foot of that hill, captain, we shall find the price of the cargo; it is but a three hours' ride now.'

At noon the hills were close at hand; and, in the clear white light of the wonderful Moroccan atmosphere, Holstein was pointing out a small black scar in the side of the centre one, and explaining that this was the cave they sought, when the figure of a man on horseback was seen in the far distance galloping furiously towards them. In some twenty minutes he had reached the head of the caravan, and then all was bustle and confusion; the camels were urged to their highest speed, and the hitherto silent escort gabbled and gesticulated excitedly.

Holstein had a brief colloquy with the messenger, and then wheeled his horse back alongside of Heriot. 'The lookouts on the hill have spied a force of the enemy. They are riding in our direction. There has been treachery.'

'And now?' asked Heriot.

'We fight,' snapped the other; 'and unless you wish to see the interior of a Moorish jail, captain, you will fight too.'

'Happy, I'm sure,' replied Heriot. 'I've seen 'em from the outside, and shall fight pretty hard to prevent my becoming acquainted with them as a lodger—they are not healthy.'

A sheikh from the head of the column now dashed down the line, and drawing rein alongside of Holstein, conversed eagerly with him. The German nodded, and the caravan gradually sorted and rearranged itself, the mounted men now pre-

ceding the camels in four compact groups of fifty men each; the camels, six abreast, bringing up the rear. No sooner was this manœuvre completed than round the spur of the hills jutting out into the plain, now quite close, there came into view a body of mounted men.

'By Jove!' said Heriot to Holstein, 'they are two to one.'

Holstein was staring hard at the opposing force through a pair of small glasses he had drawn from secret recesses of his *jellab*. 'Right, Herr Captain,' he replied; 'but we shall beat them sure enough.'

'Are your men so good, then?'

'The usual fighting tribesmen,' answered the German; 'but those others, they are Moors of the towns, and so not so good; but the odds are heavy,' he concluded thoughtfully.

As he spoke the enemy—for there was no doubt now of their quality—split into two groups, one of which swung at an easy hand-gallop at right angles to the course pursued by Holstein's men, the other galloping furiously in their direction on a parallel line, but keeping well clear.

'Soh!' grunted the German, 'they bar our way in front to the cave; they also try to cut off the caravan.'

He called to the leader of one group, and spoke rapidly. The man, his fierce, handsome face working excitedly, seemed now to assent, now to dissent, but finally to agree; he gave an order; his troop swung round and joined the camels, who were then driven on to a slight eminence and made to lie down; the troop rode into the centre of the circle thus formed, hobbled their horses, and lay down behind the camels. With this party went Heriot. Holstein had explained to him that his plan of campaign was to fight with and rout the enemy in front, while the camel-men and dismounted troop fought a purely defensive action in the rear. Should the detached party of the enemy follow up, then Holstein's detached troop were to follow in their turn and take them in the rear.

Heriot curtly declared that he should ride with Holstein.

'And charge on a beast like that?' said the German with a smile of derision, looking at the sorry horse the sailor was riding. 'No, no, mine friend, a rifle and a good rest on a camel's saddle will do us more good than seeing you killed by a better-mounted man.'

Recognising the logic of facts, Heriot disgustedly followed the troop, and prepared to assist in the purely defensive side of the coming action.

He saw Holstein, who was splendidly mounted, ride out in front of his three remaining troops; he saw the slow, rocking canter at which they approached the foe, also the sudden welding together of two troops into one, while the third shot out like an arrow at right angles to encircle the flank of the foe. He heard the crackle of rifle-fire, and then his blood boiled with excitement, for Holstein, riding a clear six lengths ahead of every one, disappeared into the ranks of the foe, and even at the distance he was he heard the shock of the charge which carried 'his crowd,' as he mentally denominated them, clean through and out at the other side; and then his attention was distracted, and he remained entirely absorbed by his own immediate affairs, as, hearing a thud, he looked round and beheld the man crouching next to him fall upon his back in a singularly unstudied attitude with a neat round hole in his forehead and the back of his head blown out. For a space of time, which he never reckoned, but which afterwards always reminded him of a nightmare, the same thing went on.

Holstein had shown real generalship in his selection of a defensive position, as it was a natural elevation in the plain rising some fifteen or twenty feet, with somewhat sharply sloping sides, on which grew thickly scrub and tamarisk, ground which could be ridden over but not rushed. Accordingly, the attacking force were foiled in their initial idea of swallowing up Holstein's horsemen by weight of numbers, and were reduced to a cautious method of attack. Inside the square formed by the camels Heriot and the tribesmen crouched and shot. The latter had possessed himself of the rifle of the man just killed, and, with an ample store of cartridges by his side, aimed and fired mechanically. What was happening to Holstein he could not guess; but surely, after the first quarter of an hour or so, he said to himself, never was there a more futile fight than the one in which he was engaged. Around them circled, mostly at full gallop, their adversaries, firing in their direction certainly, as the whine of the bullets, with which the air was filled, attested; but of execution done, one man and one horse, which Heriot noted with no great sorrow was his own, was the total of the killed, while a camel-man in the centre of the square had received a wound in the calf of the leg. Of the enemy, three had dropped and two horses had been killed; but the perpetual movement was beginning to tell upon their horses, which were becoming blown and tired. Heriot, a creditable but not brilliant shot, had just accounted for a man more venturesome than the rest, when, upon lowering his rifle to reload, he looked out across the backs of the camels to Holstein, who was sitting on a foundered horse with a white cloth tied to the barrel of his rifle. He was at the foot of the slope, and the firing in the square died down as he lifted the weapon and tore the cloth away. Then he spoke, and the men inside gave a wild cheer and rushed to their horses. As they did so another of their number fell dead.

Holstein dropped from his horse and made his way into the square on foot. The stolid, pipe-smoking, indifferent Teuton was a changed man; a dark smear of blood dripped from a slight wound where a bullet had grazed his temple, staining his fair moustache; but the blue eyes danced with the light of battle, and his voice rang like a trumpet.

'Aha, Herr Captain!' he shouted, 'a horse now if you like to ride down those dogs yonder,' pointing to the wheeling, circling foe. He caught a loose horse by the bridle and swung himself into the saddle. Heriot, with sailor-like agility, followed his example; and, passing out of the square, the troop formed at the foot of the hillock. What happened afterwards was pure exhilaration, as first one knot of the enemy stood and then another. Through them Holstein and his troop crashed, and then the fight was over, men on blown horses flying for life fiercely denied to them by pursuers who followed and shot them down one by one.

'And the rest?' asked Heriot as he pulled up alongside Holstein.

'They have run away. Did I not tell you that they would?' replied that gentleman. 'The town Moor is no fighter. If it had been otherwise, we, mine friend'—pointing to the flying figures and their remorseless pursuers—'would have been doing—that.'

. . . . . .

The Atlantic Ocean lipped and creamed on the edge of the golden sand; the *Golden Crescent* lay motionless at her anchor; a long steel rope whined through the sheave at the derrick-head as small, squat, heavy boxes, travelling slowly up her side, were swung inboard and dumped heavily on the deck. At the brink of the sea Heriot was standing talking to Holstein.

'When I came here I did not know you, Holstein. You must admit that when you had not acted up to your promise I had some cause for suspicion.'

Holstein smiled, took the long German pipe from between his lips, and blew out a great puff of smoke. 'I bore you no malice, Herr Captain, although you did mean to shoot me if I were a thief. Ach, I know; you need not tell me.'

'Come back to Europe with me, Holstein. This is no place for a man like you.'

Holstein smiled again. 'Did you think so—up yonder?' pointing with his pipe-stem in the direction from which they had arrived.

'By the Lord, no!' answered Heriot in generous admiration. 'What a soldier you are!'

'Were!' corrected the German. 'Listen! I was an officer, and I struck across the mouth an officer of higher, of much higher, rank than myself, who spoke slander—of a woman. They would have shot me had I remained, so I came here, where I trade.'

'Can you never go back?'

Holstein shook his head. 'When I am an old man, perhaps; but before that'—he lightly touched the unhealed scar left on his temple—'some day one may come even closer. And, after all, what matter? Is it not better than everlasting beer and billiards and a stuffy garrison town?'

Heriot shook him warmly by the hand. 'Good-bye, and the best of luck.'

'*Auf Wiedersehen.*'

The sailor swung himself up the side of his ship, and as she gathered way and swung hard on her starboard helm he looked over the stern to where a small party was disappearing in a light cloud of dust. 'Thompson!' he said.

'Sir,' replied the mate.

'There goes one of the best men in Morocco—or out of it for that matter. I thought he was just the ordinary beach-comber, neither more nor less, and that I might trust him just as far as I could throw him—no farther. I have found him a gentleman and a soldier.'

'Well, the *duros* are all right, anyhow,' commented Thompson.

'And I owe Holstein the most gorgeous scrap of my life,' said Heriot.

'Let's have the yarn, sir.'

'Right! Come down to my cabin. I think that this occasion merits a bottle of the best.—Steward, a bottle of *the* champagne.'

THE HUMAN ENGINE.

By Dr ANDREW WILSON.

THE idea that a good many analogies between machines of man's making and his own body are capable of being drawn is not one which prominently forces itself on the public view. Yet nature has preceded man in respect of 'many inventions' which typify and foreshadow mechanical expedients seen familiarly around us. We have a force-pump illustrated in the heart, and a photographic camera—lens, adjustment, and so forth—in the eye. We find all kinds of lever-movements exemplified in the working of bone and muscle, and we could discover examples of self-governing machinery in the nervous regulation of the heart and circulation. Valves are also duly represented in the heart for the regulation of the blood-flow in the proper direction and for the prevention of back-currents; while the whole nervous system is nothing more than a very complex telegraphic apparatus, imitated even to its batteries, its wires, its instruments, and its switch-boards.

So far, there is little difficulty in drawing many comparisons of exact nature between the furnishings of our bodies and the mechanical contrivances which characterise the march of civilisation and human progress. But beyond these details lies another field of inquiry such as opens the door to considerations connected with our body and its working powers, viewed collectively as a living machine. A little reflection shows us that all through life the body of an animal, high and low

alike, is the seat of constant change, and that this change is due to the fact that the living frame is incessantly at work. It is true that in the hours of sleep the bodily processes are slowed down; they do not, however, cease action. The heart works constantly; the rise and fall of the chest in breathing continue all through life; the process of manufacturing the fluids and secretions used in digestion (such as bile, sweetbread-juice, and the like) goes on both in sleep and in the waking state; and of certain brain and nerve centres it may truly be said that they exist in a condition of unending watchfulness, keeping watch and ward over the actions through which life is maintained. No truth of physiology is, therefore, more easily demonstrated than that which shows forth the constant work of the body. This inside labour is independent of the external work we perform; indeed, it is through the possession of the working powers just noted that we are able to perform the daily tasks our hands and brains require to discharge. Our body, therefore, is not merely a working engine in itself; its labours extend beyond the actions devoted to its upkeep, and include other duties through which the vast majority of mankind gain their daily bread.

Now, all work, whether in a watch, an engine, or a living body, implies wear and tear. There is represented waste of the substance of the machine; and there is seen waste—that is, the using up—of the 'energy' or working power wherewith it is endowed. The watch wears, imperceptibly perhaps, but nevertheless surely, until in time renewal of its parts is demanded if its time-keeping functions are to be accurately performed; but every day the store of energy we impart to it by the coiling of the spring requires to be reinforced and renewed by fresh winding. The engine also wears down its parts, and equally demands fresh fuel as the source of its working-power. The living body presents a striking likeness to both machines. Our substance wastes imperceptibly day by day; worn-out cells are replaced by new cells, and in time a complete reproduction of our tissues must take place, while our personality is wondrously maintained throughout the change. So also our store of 'energy' is dissipated in work. We grow tired and weary, and hunger and thirst afflict us, and so we need sleep and food and drink by way of supplying us with fresh power to discharge the work our hands and brains find to do.

These facts raise the question in the case of the living machine of the value of different foods regarded in the light of sources of working-power. Obviously this topic is of high social and economic interest. We should be able to select those foods which are best suited for energy-production, not forgetting that from our food we also require to draw material for the repair of the living machine itself. As a matter of fact, we do make this distinction in the foods on which we subsist. We speak of 'body-building' foods (those that contribute to tissue-formation and tissue-repair) and of 'energy-producing' foods (those which give us the 'power of doing work'). The former class includes such substances as meat-juice and white of egg (albumen), the curd or casein of milk, the gluten of flour, &c., the legumin of peas and beans and lentils, fibrin derived from blood, and like substances. The latter class is represented by fats, starches, and sugars, foods which are really nearly akin in chemical composition. Starch is changed into a sugar by the saliva of the mouth, and starch and sugar can be converted into fat, especially when the latter food (sugar) is taken in excess. In addition to these food elements we have, of course, to add water, minerals, and the oxygen breathed in from the atmosphere. These last are equally with the other items to be regarded in every sense as foods. While there is a very distinct line to be drawn between the body-building foods (called also 'nitrogenous' foods because they contain the element nitrogen) and the energy-producers, it must be borne in mind that under certain varying circumstances of life the functions of the foods may become interchangeable. On occasion the tissue-forming foods may to a certain extent be employed in force-production. But apart from this fact, the characters of the two classes of nutriments, as evinced by their functions when consumed in the body, may be regarded as being clearly enough defined on the lines just noted.

The next point for consideration brings us face to face with a great scientific doctrine, that of the transformation of energy. Here we see illustrated the indestructibility of force. All that really happens is that energy merely changes its direction; it cannot be put out of existence. A bullet striking the target converts its motion, suddenly arrested, into an equivalent of heat. A weight dropped from a height also has its motion transformed into a corresponding amount of heat when it lands on the ground. All the energy of nature which man uses in the form of steam and electricity illustrates this same doctrine. The energy stored up in coal, when liberated, raises the temperature of water and produces steam, and this steam may either itself give us a certain return for the coal in working-power, or it may be used to generate an equivalent of electrical force into which its energy can be converted when applied to the movement of a dynamo-machine. Now, the working-power of the human engine has to be calculated on a precisely similar basis. All the power it develops it derives from its food. Whatever energy it exhibits represents as truly the transformation of that which was locked up in the diet into muscular and brain work, as does the liberation of the energy of the coal when burnt account for the work done by the steam-engine. Accordingly, it has been found possible in science not only to estimate the relative values of the various foods which stoke the living machine, but also to calculate how much work day by day that machine, under ordinary circumstances, is capable of gener-

ating. Science, by the aid of the 'calorimeter' (literally 'heat measurer'), has succeeded in proving that the oxidation or burning of a given amount of food outside the body corresponds in respect of the heat generated with that produced by the chemical burning and consumption of such food within our frame. As the measure of a food's heat-producing power is to be taken as that of its energy-development, we can thus also calculate the amount of work which can be done on different foods, and likewise the body's working capacity viewed as a whole.

The standard by which we judge both things, on the English system—the foreign system differs somewhat—is founded on the 'heat-unit.' This is the amount of energy needed to raise the temperature of one pound of water one degree measured by Fahrenheit's scale. Now, if this same amount of energy were applied in mechanical work, it would raise seven hundred and seventy-two pounds weight one foot high, or (what is the same thing) one pound weight seven hundred and seventy-two feet high. We usually calculate work in terms of 'foot-pounds' or 'foot-tons.' The latter unit is the amount of work required to raise one ton weight one foot high. As we have thus got a standard or unit, the calculation of the force-values of foods becomes experimentally easy. The fats, starches, and sugars are our great sources of energy, and are therefore to be regarded as our typical working-foods. One calculation teaches that one hundred parts of fat are equal in value as energy-producing material to two hundred and thirty-two parts of starch, two hundred and thirty-four parts of cane-sugar, and two hundred and thirteen parts of the body-building albumen. The German army medical authorities were wise in their day and generation when they insisted on a large proportion of fat being included in the soldier's ration.

It may finally be asked, what power is the human engine capable of developing on the fuel with which it is supplied? This question can be answered with a very near approach to correctness—as near, indeed, as we can ever approach exactitude when dealing with the continually varying conditions of a living body. Man's bodily work is divisible into two categories. First, he has to produce heat, itself a large item in the working-expense, and to provide power for the internal work of the frame. The heart has to be kept working, the muscles of breathing have to be provided for in the way of energy-supply, and even the act of digesting food to repair the body involves the expenditure of energy, illustrating thus the burning of the physiological candle at both ends. The second phase of work done by the bodily engine is represented by that which is external—that is, the work of our muscles and the daily labour in which we may otherwise be engaged. The body's own energy expended in maintaining heat and in providing for the upkeep of its internal work has been calculated at about two thousand eight hundred foot-tons per day. Put into a big lift, so to speak, this amount of work would raise two thousand eight hundred tons weight one foot high. The external work on the same basis is given as amounting on the average to about three hundred foot-tons daily, while a very hard worker may develop from five hundred to six hundred foot-tons. But it would seem that even to get the bare outside work of the human engine done we need to develop actually about five times its amount, *plus* that needed for the internal work. So that if we are to allow three hundred foot-tons for the outside labour of the body, we have really to provide one thousand five hundred units, and to add to this the two thousand eight hundred required for the body's own affairs, making a grand total of some four thousand three hundred units to be generated every day we live.

Now, though these figures seem large, they nevertheless represent economical work when all is said and done. A man's total daily income of food, water, and air amounts to about eight and one-third pounds only; yet out of this modest supply his body generates power far exceeding in amount and in direct and economic usage that produced by the best engines of his own invention. The waste seen in the engine, due to friction and to loss of power in getting at its work, so to speak, is largely obviated in man's own body. While only a small percentage of power for the coal burnt is returned to us by our finest engines, our own body yields a very generous amount indeed, having regard to its small fuel consumption. If we think that a man's heart alone, in twenty-four hours, expends one hundred and twenty foot-tons of energy—force sufficient to raise that weight one foot high—we may see how admirably living nature orders her ways of income and expenditure. The profit, in the shape of 'the power of doing work,' we get out of our food and drink and air is really a very handsome one. Most wonderful of all is it for us to consider that all man's achievements, physical and mental alike, represent part of the profit accruing from the transformation of what he eats into what he does.

AN IRISH FISHING-GILLIE.

By 'CATHOGUE.'

IN every sport that I know there is a strong feeling of comradeship that binds together those who pursue the sport merely for pleasure, and the familiar spirits—as, I think, I may properly call them—who make their living out of it, and frequently eke out with their knowledge the inexperience of the amateur.

The hunting-man is, as a rule, on friendly terms with the huntsman; but the latter's duties permit of very little conversation when hounds have once reached the covert side. One may say much the same thing about the gamekeeper, who is, moreover, frequently taciturn and preoccupied, owing to the nature of his work and the difficulty of ensuring that his pheasants shall be properly shown or his partridge-drives correctly carried out. The cricket professional is often an extremely pleasant companion, and we get to know him very well; but perhaps he comes into a somewhat different category.

Among the innumerable attendants who accompany a man and assist him in the divers forms of sport, there is probably no one with whom he becomes so intimate and familiar as with the gillie who is his companion—and, if he be a beginner, his adviser—when he is in pursuit of that noble quarry the salmon.

When I think of the fishing-gillies I have met, my mind at once goes back to one Tim M'Carthy, an Irishman of the best type, and a sportsman from the crown of his rusty head to the soles of his ample feet. He haunted a certain river in the south of Ireland, and he it was who gave me my first lessons in the art of casting a salmon-fly, and subsequently landed my first fish.

I can picture him now as I arrived on an outside-car at about 11 A.M. on a beautiful spring morning, after the long journey from England. He was awaiting me on the bridge over the river, and gravely held up his hand to stop the car exactly like a well-seasoned Metropolitan policeman. The owner of the water, whose guest I was, had warned him when to expect me, and directed him to have everything in readiness.

'Marnin', yer 'onner,' he said. 'If ye'll be gettin' down we'll thry down a pool or two. She's in great arder altogither.'

Now, I had had no intention of fishing until I had reached my destination and changed into suitable garments; but Tim's eye was upon me, and he was already trying to drag the rod-box off the car; so there was nothing for it but to acquiesce, which I did not unwillingly.

Tim, having secured the rod-box, proceeded to investigate its contents without a moment's delay, and I had time to take stock of him. He was about five feet four inches high, and enormously broad in proportion. His head was covered with a shock of rusty-red hair, and there was a good deal of the same material all over his face, which looked as if he shaved possibly once a week (probably for mass on Sundays); but the delightful feature was his eyes—they were of the brightest blue, and had a most wonderful twinkle in them whenever he spoke—they gave one confidence in the man at once, and one could not help feeling that here was a cheery, good sort.

He was dressed in an old shooting-coat which had evidently been given to him by one of 'the fishing-gintlemen,' as he called them—the said 'gintleman' evidently having been quite six feet two inches in height, since the skirts of the coat hung down to Tim's knees; he also wore 'gift' breeches, with heavy leather gaiters, and the most prodigiously large pair of boots that I have ever seen on a man of his size. These, with a battered old hat, completed his outfit.

Whilst he was being looked over, Tim had got out the rod, put it together, and was testing the weight, balance, &c. by a few preliminary swishes.

'What do you think of the rod?' I asked.

'Well thin, ut's not too bad,' observed Tim, 'but ut's not over sthrong in the middle jint.'

Now, although I had killed a good many trout, I knew nothing of salmon-rods, this one being, in truth, the loan of a friend, so I held my peace.

The line was soon run through the rings, and a trace, which Tim had soaked in readiness, was quickly attached, and we went down off the bridge on to the bank of the river.

It should here be explained that he always called a fresh-run salmon a 'tidy,' and an old fish either a 'slack' or a 'kilt.'

The next step was the selection of a suitable fly. Now, the friend who had provided the rod had also taken me to one of the best fly-tiers in London, and selected a stock of flies for me, which I duly purchased at what seemed to me fabulous expense. Tim opened the fly-box and looked gravely through the whole lot, and an expression of the most sublime contempt spread over his countenance. 'Thim do be shop-flees,' he said. 'Wait, noo, whilst I show ye a *fisherman's* flee.' So saying, he produced from the greasy lining of his old hat an outrageously roughly tied pattern, and after freely wetting his first finger and thumb in his mouth, straightened the wing out affectionately and proceeded to attach it to the cast. He then handed over the rod, saying, 'Noo, yer 'onner, lit off some line.'

It was an awful moment. Imagine one who had never had anything larger than a ten foot six inch trout-rod in his hand suddenly receiving a seventeen foot six inch pole, and being told to get his line out!

Concealment was of course useless, so Tim was

informed that I had never used a salmon-rod before. His face fell a trifle, but his eye soon twinkled, and he said, 'No matther. All the wurruk ye have to do is to make the rod do the wurruk'—a quaint saying that I shall always recollect. He then pointed out a rock showing above the water, which appeared to me to be about as far as I could throw a cricket-ball from where we stood, and invited me to throw the 'flee' across it and let it come round below the rock. To cut a long story short, my casting, of course, was hopeless, and the line fell for the most part in large rings at my feet.

When he once understood that he had an absolute beginner, then did I realise what a capital little fellow he was. Firstly, he made a few casts himself to show me how to 'shoot' the line, and then handing back the rod, he kept his pupil at it till his back nearly broke. In vain did I tell him that my arms ached, likewise my back. All he would say was that the more I fished the less I should feel it. Moreover, he added, very truly, 'If yer 'onner kapes the flee on the bank, the fish wouldn't be leppin' out of the wather afther ut.' Well, all down the pool we went, flogging all I could reach, and probably terrifying every denizen of it out of the place. When we reached the tail I struck work, and sat down, firmly refusing to touch the rod again until I had had a good rest. Tim allowed this, and lighting a marvellously black little pipe, also sat down and gave me sundry wrinkles. He was delightful to talk to, and as keen as mustard, and assured me that we should get a fish before long. We then returned to the top of the pool again, and went through the same performance several times more, until things began to go better, and Tim, after satisfying himself that he had fairly exhausted his man, allowed me to depart in peace. His patience was wonderful; he took infinite pains to point out mistakes, and was manifestly pleased whenever the results were good.

The next day we fished in earnest (the first effort having been a lesson pure and simple). I verily believe that Tim watched every single cast, and we made considerable progress. In the afternoon a fish came up at the fly—a beautiful head and tail rise—took it well, and was firmly hooked. The excitement was simply ghastly! To my horror, Tim, who had seen him well, said, ''Tis nought but a dhirty ould kilt, yer 'onner, but 'twill be great thrainin' to play him.' It was a great disappointment, but he was a big fish, and the playing of him certainly did teach me a great deal; added to which there was some grain of comfort in the thought that if he did get off it didn't matter! After he had towed me about for some twenty minutes, Tim insisted on very severe measures, and eventually tailed him for me. The worst part of it was putting him back!

On the third day we had two more 'slacks' out on the bank, amidst much exhortation and advice from Tim; but there was no sign of a fresh-run fish.

The fourth day was the successful one. We had fished for about an hour without a rise, when just as the fly was coming nicely round I saw the wave made by an approaching fish. It was a moment of intense anxiety. As the fish reached the fly, in spite of Tim's previous warnings on this identical subject I struck hard, and of course back came the fly.

I looked round at Tim, and his face was a thing to remember—a look of blank despair was on it, the twinkle had gone from his eye, and I felt that he regarded me as a criminal. For a moment he said nothing, and then, 'Begor, if ye pull the flee out av his mouth, whin he's afther thryin' to take ut in, the divil a fish *ye*'ll iver catch. 'Twas a tidy, I tell ye; no ould slack was iver afther lyin' in *that* strame. 'Twas a tidy, begor, and ye just tore the flee from him;' and so on, with amazing volubility. No 'yer 'onner' this time! Indeed, my honour as a fisherman had departed. 'And what was ut I *told* ye about sthrikin'?' asked he, with sublime scorn.

Truly I had but little to say in self-defence; I muttered something about being accustomed to strike quickly at trout; and then suddenly the infuriated little man realised that my disappointment was possibly almost as great as his. His face relaxed, and back came the twinkle. 'Wait now, yer 'onner,' said he; 'we'll let him rist a shpace, and maybe he'll come agin. Take it aisy if he do be comin', and, begor, maybe we'll kill yer firrst tidy yit.'

I felt distinctly nervous, and we both gravely filled and lit our pipes.

Tim then gave precise directions as to the exact spot to begin to fish, some little way above where he believed the salmon to be lying; he looked at the cast and fly, and handed me the rod. 'Noo,' he said; and I began. I can see that first cast in my eye as I write. *Something* went wrong; the line didn't 'shoot,' and the fly went into the water much after the fashion of a shell from a ten-inch gun.

'Holy murther!' I heard muttered into my left ear; 'but ye're plinty above him yit.'

The next cast was better, and gradually we worked down to the place where the salmon had come up the first time. I heard the word 'Aisy!' hissed into my ear, and almost at the same instant up came the fish. After what seemed an eternity, but what was in reality perhaps a second, I felt him, and tightened on him. Glorious moment! he was on this time, and apparently well hooked.

And then the torrent of advice that came from the erstwhile counsellor of 'Aisyness!' If ever a man was *un*easy, of a surety Tim holds the record. 'Lit him run! Lit him run! Don't be houldin' him! Kape opposite to him!' he roared; and then, as the fish jumped and showed himself well, 'He's a tidy, I tell ye, and as wickud as a pup-dog. See now, dhrop the pint to him as he leps or he'll bate us,' and so on, with a never-ceasing stream of advice, cautions, and even threats. I peeped at him quite early in the encounter, and well remember

noticing that, although the day was bitterly cold, he was in a state of profuse perspiration.

The fish played very gaily, continually 'lepping' and making terrific rushes; but, hard as he worked, I almost think that Tim worked harder, and I'm sure I did. We tore along the bank to keep opposite to him, and there was a thrilling moment when it was necessary to get over a fence and pass the rod round a tree. Once he rushed straight in at our feet, and for a second there was slack line; Tim let loose the most appalling oath (when I reminded him of it afterwards he vowed he had never said it); but, mercifully, when the slack was recovered the fish was still on.

This went on for a long time—I have no idea *how* long, but it seemed hours—and finally the salmon began to show more freely, and to turn on his side. Then came orders as to what was to be done to bring him to the gaff, all delivered *fortissimo*, with Tim's head about a foot from mine. The excitement was terrific. My host appeared on the opposite bank and laughed at us till he cried. He afterwards told me that he was fishing quite a long way below us, when he heard Tim's yells borne on the breeze, and, at once guessing what was happening, he ran up to us.

Gradually I got control of the fish, and by degrees worked him up to where Tim was crouching with the gaff. The salmon saw him, however, and once more made a run for mid-stream, but it was his last effort, and he came in again at once, nearer and nearer to that intent little figure, who reminded me exactly of a terrier watching a rat-hole. I saw Tim's arm go out, a lightning stroke of the gaff, and then—a loud splash; and Tim had overbalanced himself in the act of lifting out the fish, and there he was in the river up to his armpits, whilst up on the bank, with the gaff still in him, lay the kicking fish. I rushed at the latter, and moved him to a safer distance from his native element, and then I sat down and laughed at Tim till my sides ached. He laughed too as he scrambled out, and did not care a scrap; but his delight over my having killed a 'tidy' of fifteen pounds was absolutely touching.

We then resolved ourselves into a mutual admiration society, he praising my villainous fishing, whilst I pointed out the brilliant cleverness of his advice. I had carried a certain coin of the realm in my pocket each day, intending to give it to him if we killed a clean fish. This was now produced and handed to him. He looked at it gravely for a moment, then spat on it, and, producing a piece of dripping-wet newspaper from his capacious pocket, carefully wrapped it up, and placed it in the breast-pocket of his coat. 'I take ut vary kindly of yer 'onner,' said he, 'and I do be tarrible plazed we kilt the tidy betwane the both av us; 'twas a great wurruk althegither.'

After a sip at my rather large flask, I handed it to Tim and told him to have a pull. He proceeded to pour the remainder of its contents down his throat, without winking, remarking, as if he had done nothing particular in swallowing about half a pint of neat whisky, that it was 'purty stuff.' Then, since I had to be in early, and, moreover, could not keep him out in his wet clothes, we proceeded home in considerable triumph.

During the remainder of my stay we killed four more clean fish, and had capital fun with them; but I do not think that Tim enjoyed any of them as much as he did the first one. I know that I didn't.

When the time came to leave for England once more I was quite depressed at parting from the little man; he was always the same, courteous and cheerful, and had one of those charming natures that rejoice in the good sport of others as if it was their own. I never spent a dull moment with him, and I never worked harder in my life than during those days, for the one thing he insisted on was that the 'flee' should always be on the water. I sincerely hope that we may meet again some day. My last glimpse of him I remember well; he was standing on the old bridge with Mrs Tim, surrounded by a considerable portion of the contents of his 'quiver' (which was a fairly full one—there were twelve children, I think), waving his old caubeen, and shouting, 'Safe home, yer 'onner!' as the car turned the corner.

THE MAKING OF DIAMONDS.

THE diamond has a most eventful history. No single country claims to be its birthplace, nor is it always found under the same conditions. Its home may be in India or South America, Australia or South Africa, Russian Lapland or the plains of Arizona. It has been discovered among the pebbles in a stream, embedded in the boulders of an igneous rock, in gold-washings, in meteoric iron, and (if we can believe Sindbad the Sailor) in beefsteaks brought up from inaccessible valleys by eagles and vultures. It varies in colour no less than in weight. It may be white (or what naturalists call colourless), with an occasional tinge of yellow, red, orange, green, and sometimes black.

Ever since the old Greeks called it *adamas* (the invincible), the diamond has exercised a peculiar fascination. To discover its composition hundreds of gems have been destroyed. Composed of only one element, and that the commonest in Nature, it stands alone among precious stones and constitutes a class by itself. Many strange tales have gathered round its quest. We read of diamond-hunters, diamond-smugglers, diamond-thieves, and diamond-makers. It has been counterfeited in paste and

actually produced by chemical art. In fact, there is and always has been a diamond cult.

How does Nature make the diamond? That is Nature's secret, which nobody knows. Various theories, ranging from the suggestion of a vegetable process to the crystallisation of carbon at great depths under the earth's surface, have been propounded. Sir David Brewster maintained that the diamond was fossilised resin deposited from the sap of a plant, just as a peculiar variety of flint is found in the branches of the bamboo. This view was accepted by Jameson, the famous mineralogist of his day; it was also favoured by Petzholdt, who based his conclusion upon an examination of the ash which is sometimes left after a diamond is burned. Others have maintained that the diamond is made from carbon which has crystallised after being in a liquid condition. Intense heat and pressure, it is said, have liquefied carbonic acid, and as the liquid cooled the formation of the diamond began. Others, again, have maintained that the diamond has been crystallised from molten iron. A remarkable discovery of sixteen years ago lends support to this view. It was supposed that the plain of Arizona contained a vein of iron from the fact that many pieces of the metal, some of them of considerable weight, were found lying on its surface. The iron was pronounced to be meteoric, and when an attempt was made to cut one of the pieces it was found to contain certain hard grains which resisted cutting. These grains were declared to be diamonds. The declaration made such an impression that one of our distinguished scientists suggested that the diamonds which have been found under isolated conditions in sands or gravels on the surface of the ground may have had a meteoric origin. It is well known that acids will dissolve iron and leave a diamond unaffected. The atmosphere will do the same if the iron be exposed to it long enough. Had the Arizona iron been left exposed the diamonds, in the course of time, would have been liberated, and be found distributed over the soil. Hence the conjecture that single diamonds picked up occasionally on superficial deposits, though regarded as minerals, may have had an extra-terrestrial origin.

After all, there is evidently no single mode of origin common to all diamonds. The latest conclusion is that, in different deposits, the gem has been made in different ways. When it occurs in a crystalline igneous rock—as in India, Lapland, and South Africa—it is supposed that it was during the cooling and subsequent solidifying of the rock, after passing through a melted condition caused by volcanic agencies, that the diamond crystallised, its carbon being either present as part of the rock or derived from some carbonaceous source outside of it. When, on the other hand, the diamond occurs, as in Brazil, with crystals of quartz, it has evidently been made in a different way. The scientific name of quartz is itacolumite; it belongs to the group of rocks known as metamorphic. This means that the rock was originally deposited from a watery solution, and probably even at an ordinary temperature. In Brazil the earlier diamond-hunters searched for their treasure below the beds of rivers, digging through the upper clay to the quartz-vein beneath and finding the gem there. In this case the conjecture is that the diamond was made in the same way as the quartz in which it is found. This, however, brings us no further than the point at which we started. Nothing is known regarding the character of the solution by which the diamond is deposited in its matrix, and so the natural origin of the gem is still to a great extent shrouded in mystery.

But though the secret has been so well preserved, the composition of the diamond itself has long been known. The ancients had no suspicion of the true nature of the element of which the diamond is made. They fancied it was a kind of crystal. Even as late as the middle of the eighteenth century, an authority on physics defined its composition as 'the purest and finest earth, the most ethereal fire, and the most limpid water.' Modern chemistry has changed all that. The most refined experiments of Lavoisier in France and of Davy in England have proved that the diamond is pure carbon in a crystalline state. This conclusion, however, was not accepted without question. It was hard to believe that the precious gem and the common element carbon were one and the the same thing. Accordingly Guyton de Morveau made further experiments with a view to confirming or rejecting the conclusions of Lavoisier and Davy. Morveau's method was so different from the usual procedure that we cannot help admiring its boldness and ingenuity. It is well known that a piece of soft iron, when heated with charcoal or carbon, absorbs some of the charcoal and becomes steel. Morveau substituted diamond for charcoal, and he converted a fragment of soft iron into steel identical in every respect with the steel produced by the usual method. The question of the composition of the diamond was thus finally determined.

No other gem consists of one, and only one, element, and this apparent simplicity has not only attracted artificial production, but has also been the insuperable barrier which has hindered success. Artificial diamonds have certainly been made, but on such a small scale that they have been practically useless. By the term artificial we do not mean a glass or paste imitation, but the real substance, so made by chemical art that the product is the same in every respect as that made by Nature. Different workers have employed different methods, and with varying success. In 1853 the method of Despretz consisted of depositing carbon by the disruptive action of the electric spark in a large vacuum tube. The carbon was deposited on platinum wires, and the deposit, when viewed under the microscope, had certain remarkable features. At the ends of the wires some points were seen which experts pronounced to be octahedral crystals—the form in

which Nature gives us the diamond. In colour they were black and white. Tested upon hard stones, the substance polished a ruby. As diamond is the only substance that polishes ruby, the deposit was pronounced to be the powder of the diamond.

The next notable attempt was made in the direction of dissolving carbon in a liquid. Sugar or salt dissolved in a liquid leaves the crystals of sugar or salt behind when the liquid has evaporated. In the same way, if we could dissolve carbon, either as charcoal or lamp-black, and by the evaporation of the liquid allow the dissolved carbon to separate out, it would probably crystallise in the lustrous form of diamond. In 1880 J. B. Hannay, a Glasgow chemist, conducted a series of valuable investigations on the solubility of solids in gases, and claimed the discovery of a solvent for carbon. He was the first to dissolve silica in a gas. He found that the metal lithium could separate the carbon from a hydro-carbon—that is, from a compound of hydrogen and carbon. He placed lithium and paraffin—the latter being the hydro-carbon—and some sperm-oil in strong wrought-iron sealed tubes, which were then exposed to enormous pressure and high temperature. Out of numerous experiments only a few had a measure of success, Hannay's difficulty being to get tubes strong enough to resist the heavy pressure and the intense heat. Though the sides of the tubes were three and a half inches thick, they exploded as if built of cardboard. Hannay expected that the carbon, separated by the lithium, would dissolve in the sperm-oil, and that when the solution cooled the carbon would crystallise in the form of a diamond. The result was a crystalline mass. It was diamond, but in the form of a fine sand.

The next worker in the same field was the French chemist Moissan, whose researches on the distillation of metals have attained a world-wide fame. Moissan used molten iron as the solvent. He placed carbon in an iron cylinder, and put the cylinder in a bath of boiling iron in the electric furnace with its temperature of three thousand five hundred degrees centigrade. The cylinder, under these conditions, became soaked with carbon. The hot mass was then plunged into cold water. This solidified the molten iron. Molten iron, like water, expands as it solidifies. Moissan thus produced a strong solid crust which held the inner molten mass in its grip. As the inner mass cooled its expansion produced an enormous pressure. Under this pressure the dissolved carbon separated out in a crystallised form. The size of the crystals did not exceed one-fiftieth of an inch across, but they proved to be absolute diamonds by withstanding all the known tests. They were completely combustible in air, they yielded carbonic acid gas as the sole product of combustion, and possessed the hardness and refractive qualities of the natural gem.

More recently a method of artificial production has been devised by Friedlander. A piece of olivine—the glassy, translucent species of silica, of a light olive colour—after being fused under the blowpipe, was stirred with a rod of soft carbon. On cooling, the silicate was found to contain a number of crystals which were even smaller than those obtained by Moissan. The crystals had the diamond or octahedral shape, they resisted acids, were refractive, burned in air, and scratched ruby.

The investigations of Moissan and Friedlander, apart altogether from the size of their artificial diamonds, are valuable in one respect. They afford a plausible theory as to Nature's mode of working. Moissan helps to solve the mystery as regards the diamonds found in meteoric iron. Friedlander does the same with regard to those of South Africa—that these may have been formed by a molten silicate acting on a carbonaceous material. The problem, however, may be solved otherwise. It is quite possible that if Moissan's process dealt with a few pounds of iron instead of with a few ounces, subjected to greater pressure and higher temperature, the result would be larger diamonds. It is in this direction, judging from the conditions already known, that success seems to lie. A higher temperature than three thousand five hundred degrees centigrade has just been produced. It has been accomplished by Sir Andrew Noble in exploding cordite in a closed chamber. A temperature of five thousand two hundred degrees centigrade was reached, and a pressure of fifty tons to the square inch. The temperature melted carbon, and from the melted carbon diamonds were naturally expected. On analysing the carbon in the explosion chamber, minute diamonds were found in it, proving that before crystallisation the element had passed through a liquid condition. These results may be the forerunners of a greater achievement. The crystals already produced artificially, though inapplicable for ornament and having no commercial existence, may be the first fruits of the secret which Nature shall yet give up. And when she does give it up absolutely, the chemist will not be surprised.

THE ANGEL'S CHOOSING.

A BABE one day in his cradle lay,
While the mother softly sung,
'God grant my child rest undefiled
Till the last low bell be rung!'

An angel flew from the vaulted blue,
And whispered in voice of love,
'Your boy must share the world's dread care,
Or return with me above!'

The mother knew not what she must do:
'Blessed angel, choose for me—
I would leave the choice with thee!'

The angel smiled as he kissed the child:
'The Master would have him stay,
To fight the fight against sin and night
Till the dawn of eternal day!'

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

IT has seemed to those who associate with them that members of Parliament are in a gentler, more conversational, and more reminiscent mood at the beginning of an autumn session than at the first start of the business of the year in February, when they are too fierce politically for the easy administration of the social amenities. In February the member conceives himself to have a great mission, to be bound up with a great duty, and he is constantly suggestive of springs and electricity and an eternal restlessness. But the labours and disappointments of the session subdue him, and his late summer holiday—on the moors, or on the golf-links, or at some Continental spa—yield a certain mellowness to his spirit, so that he seems to be a more human man when he forgathers with others of his kind a day or two before the beginning of that extra term of parliamentary work in the autumn, and on to nearly Christmas, which comes to be regarded as an almost inevitable feature of the Westminster programme in these strenuous days. So at this time good stories of parliamentary life and events are recalled and told, which, if not absolutely original in all cases, come quite fresh to the ears of most people. And the other night in a little company of parliamentarians returned to town the conversation turned on certain matters affecting the position of the Speaker; and one of the group told a strange tale of how some six years since the entire House of Commons collectively nearly committed a fault the proper punishment for which would have been imprisonment in the Clock Tower as prisoners of State until it should have been the gracious pleasure of His Majesty the King to let them go free again and resume their arguments upon the merits and demerits of various Bills. It was in this way. The time was the middle of February, when the House was feeling very energetic and greatly desirous of doing something. It came to the conclusion that it should appoint a Deputy Assistant-Speaker who, in the possible contingency of the Speaker and his assistant both being indisposed at the same time, could perform their duties and, if it became necessary, enforce the closure—this latter being a power which is withheld from an ordinary Chairman whose services might be casually employed. The suggestion came from the Prime Minister, and the House was going forward to make the appointment, when up jumped a member and frightened the House exceedingly by the information that it was contempt of the Throne—or *lèse-majesté*, as it is called in another country—in a most aggravated form even to discuss such a subject in a quite informal way without first having gained the permission of the Sovereign to do so. A very little consideration showed the House that this was indubitably true; and it shuddered, so it is said, at the thought of the heinous offence that unwittingly it had very nearly committed. What should it do then? Of course it immediately ceased discussion of the subject it had taken in hand, and some members are said to have pretended that they had never heard of such an office as that of Deputy Assistant-Speaker; while in the meantime one of the Junior Whips of the House was sent off post-haste in search of the King, found him at Marlborough House, and came back with the pleasing intelligence that His Majesty intimated he had not the smallest objection in the world to his faithful Commons discussing this matter to any length and in any manner and to any effect that they desired. Thus it was well. Later, *à propos* of the Suffragettes (of whom it is being said that they will now always be with us until some abnormally strong Parliament passes a new Act for the imprisonment of all of them), another member related anecdotes about interruptions in the House; and a couple of his stories, resurrected from some private records of his own, were good. The incident contained in one of them occurred a few sessions back. A keen debate was being pursued when the shrill voice of a child in the Ladies' Gallery was heard, saying joyfully, 'There's daddy, mamma! There's my

 [*All Rights Reserved.*]

daddy!' Honourable members were amused and smiled; but officials, who are not allowed to be amused at any irregularity, were apparently angry. Up they went to the Gallery, where they found that the offender was the three-year-old son of Mr John Dillon. Mrs Dillon and her little boy had been granted seats in the private section of the Gallery reserved for the wife of the Speaker, and the boy, evidently possessed of some considerable hereditary instinct, had no sooner arrived than he began to manifest the keenest interest in the proceedings. Ultimately the Speaker's private secretary went aloft to suggest that as yet Master Dillon could not be allowed to address the Chamber, though there would quite likely be strong possibilities for him in the future. So the mother and child took their departure, Master Dillon loudly protesting and declaring, 'I want to make a speech, mamma! I want to make a speech!' Ireland has more leaders coming along. And this pretty story reminded the teller of another childish interruption, in which case, again, the child was that of no ordinary father. Lord John Russell was Prime Minister and Leader of the Commons, when one day a childish voice was heard from behind the ladies' grille, saying, 'Oh, mammy dear, there's papa!' The House, as usual, was quite pleased; but Mr Speaker instructed the Serjeant-at-Arms to go up and 'request the lady in charge of the squalling bairn to leave the Gallery at once.' In answer to the Serjeant's question, the Speaker said that he would leave it to his discretion as to whether he asked the lady for her name or that of the father of the bairn. Thereupon Mr Bernal Osborne got up and exclaimed, 'A wise child knows its own father; it is Lord John Russell's baby!' And as the Serjeant went off to perform his duty, and duly did so, the House laughed boisterously.

* * *

Why do the people and the papers make so much of Mr Winston Churchill? That is exactly the question that most men have asked of themselves and some one else at least once during the last few weeks, and generally there does not seem to be any satisfactory answer forthcoming. When he was married the other day the event appeared to attract as much attention as if it were the wedding of a Prime Minister or a Princess of the Royal House. There sometimes looks to be as much interest focussed on this young man, still in his early thirties and a Cabinet Minister of less than a year's standing, as if he were established beyond dispute as one of the greatest men of the day, and one who had been of the utmost service to the State. Let us not be misunderstood. Most men agree that Mr Churchill is an exceedingly clever man, and that no young person of the time is as likely to go very far in statesmanship. And he looks it all. He has cultivated a style of appearance that suits his part most excellently. Young as he is, he stoops low in his walk, as if the cares of the State already weighed unduly heavily upon him, and he helps his appearance of age by constantly wearing the square-topped shape of felt hat which is generally regarded as the private and particular wear of gentlemen who have become well established in middle age and see no further reason for disguising the fact. Big pockets in his Chesterfield overcoat, the expansive wings of his collar, and a dozen other smaller items of attire and manner all combine to accentuate this look of age and experience, and the finishing touch is imparted by the look of tiredness and strain which hangs upon his fine intellectual face. Mr Winston Churchill himself would not, we imagine, deny that he is very considerably a showman; and it is very difficult to get on in Parliament in these days unless one is a showman. But because he gives these impressions, and because of his apparent cleverness and his frequent amazing but most remunerative audacity, and because we feel that he will some day be a very much greater man than he is now, are really not reasons why the people should make so much of him at the beginning of his career. It is contrary to rule to do so; since in this country it is our practice to recognise in this way only the achievement, and not merely the promise of it. The fact is that there seems everywhere and at all times to be a conspiracy in favour of this young statesman, and the conspirators include his enemies as well as his friends; indeed, we have heard it said that more of them are enemies than friends. His career so far has been roses all the way. People began by taking notice of him because he was the son of a dazzling political genius and of a lady who is quite one of the most brilliant intellectually of her time, and they regarded his future as an interesting experiment in heredity. If, they said, there is anything at all in breeding, this young man should be a wonder. From that time it has become a habit, and an increasing one, to take notice of him, and so he has never suffered from that terrible handicap which has blighted the prospects of men perhaps quite as good as he is, that they have never been able, despite constant endeavour, to make the people notice them once to begin with. They could not make a start. Mr Churchill was started at once, and his own audacity has enabled him to score the maximum number of points for himself at every one of the countless opportunities that have been presented. People do not any longer resent that audacity; they would be sorry to miss it. But it was not always so. We remember a story that was very frequently told about the time of the Boer war, when Mr Churchill first set about the task of making himself famous in real earnest. No war-correspondent is so well known, of such ripe experience, and of such great achievement as a certain gentleman connected with a leading London journal, and one evening during the war he and a few other correspondents were chatting together on the stoep of the Bloemfontein Club when they were joined by Mr Churchill, who went forward to congratulate this veteran on his

great feat in getting away from Ladysmith just at the right moment. 'Mr Blank, that was the finest thing you have ever done in journalism in the whole of your life; it was absolutely great,' he said. No doubt he meant to be nice and kind; but it might have been better if he, so young and inexperienced, had expressed himself in some other way. And nobody who knew him was very much surprised when the other, nettled, replied, 'Boy! it is presumption in you to tell me what is the greatest thing I have done in my life—you, a lad, just beginning your career!' Nevertheless, Mr Churchill made a good deal for himself out of the Boer war, and his tales of his escape from Pretoria, of his ride in the wagons of a luggage-train, of the time when he laid himself down wearily under a tree, the picturesqueness of his subsequent narrative being then helped considerably by the timely appearance of vultures who perched on the branches above and probably speculated on the number of hours that their man was likely to hold out—the accounts of all these matters made fine reading for people who like that sort of thing. It may be taken for certain that Mr Churchill knows his business, and he has framed a policy for himself which, though original in many features, is winning all along the line. We do not seek to depreciate him, nor do we regret that he is so successful and that he is so much noticed when, as we say, we do not know why. He is a refreshing novelty in public life. Some day he will justify all this interest, and experience will give that stability to his principles which his detractors say they are most in need of. In the meantime he is a pleasant as well as an interesting character, and all who know him speak of his kindliness of heart.

* * *

In the big town November is not generally an unpleasant month. The workers of all degrees are fresh with the vigour won in the holiday-times, the atmosphere is cool and invigorating, and a bronzed mellowness seems to overhang the streets. Such, too, is the love of variety and change that we welcome each new season as it comes; we even seem to rejoice in the donning of winter clothes, and we regard the dark evenings by the fireside as among the most joyful features of our social arrangements. The novel, the theatre, the concert have an attraction for the average person in November that they have not in May and June. But the fogs! the fogs! Yes, there are the fogs, and at these we do indeed grumble and growl vehemently, and we make out that they cause us nothing but misery and aggravation, and that we hate them accordingly. Without doubt, when we get two or three days of an unceasing and most impenetrable fog that seems as if it never would lift, the patience of the Londoner is most sorely tried, and he rails against the men of corporations and the men of science because they do not find any cure for this evil of London life. Yet we may bring ourselves to believe that this townsman would even miss the fogs with a faint trace of regret if it were brought about that he was never to have the thinnest of them evermore. Something that was familiar and that caused much discussion would have gone from his life, and we would not have even all our enemies removed entirely from the scope of our consideration. We do believe that it is with more of a smile than a frown that this townsman looks out from his bedroom window at the first fog of November. He seems to have been given a reassurance. He knows that the old order of things is maintained, and that the world, which has very likely not done badly with him so far, is just what it was. The annoyances that follow, in late trains, unkept appointments, stoppage of cabs, and so forth are relieved by little excitements; and there is something wholesome in the breaking of the vast monotony in London business-life. A tangible and absolute excuse is provided in a sphere of work in which for the most part no excuse is ever accepted for a deviation from routine. The folks of lesser responsibility will laugh and joke about the fog, pretend that it necessitates their gathering in club smoking-rooms and drinking punch, while others have at various times been known to make wagers upon it—as to the hour when it would lift, upon the actinic value of the light as evidenced in photography, as to the difference it would make in the weekly returns of certain railways, and so forth; while it has been held by participants that one of the finest forms of sport is racing through London in a dense fog either on foot or with hansom-cab! It is a sport for bold men of strong nerves and great resource, for accidents may happen and ways may be lost. During the thickest fog of last season, when things were so bad that cabs had ceased to ply for hire and there was a congregation of idle omnibuses in Trafalgar Square, four worthies whose time was hanging heavily on their hands held a race with hansom-cabs over a three-mile course along the chief thoroughfares in the heart of London for a handsome stake. Race it was, but not such a one as could be banned by the authorities, for the speed was low and the competitors were not even to be seen by the policeman. It turned out that the winner, adopting the slow and sure principles of the tortoise in the fable, led his horse by the bridle from the beginning to the end. Foot-races in fogs have been common, and some of them have become quite historic. Thus there was one at the beginning of 1865 between Robert Bethell and Joseph Dee, which was a veritable Marathon race in its way. Their course was from Charing Cross to the Royal Exchange, and the arrangements for the event were organised in the most thorough manner. What might be called stewards were stationed all along the route, whose business it was to see that each competitor passed that way, or rather hear him, for the fog was so thick

that a man could not see his own hand, and these befogged athletes had to sing out passwords as they strode along, as proof of the fact that they were proceeding on the proper course and in the proper manner. Many adventures befell them. But a few yards had been traversed when one injured himself considerably through collision with a hackney-carriage, and a little farther on his rival knocked down a linkboy who was leading an old gentleman across the main thoroughfare to Waterloo Bridge. The gentleman belaboured him with his stick, and the incident caused the runner to lose his bearings, so that a little while afterwards he found himself in an alley off Drury Lane. Meanwhile the other made Ludgate Circus half-an-hour after starting, and an exciting finish was promised; but Bethell's haste down Cheapside attracted the attention of a policeman, who ridiculed the suggestion that an important race was being run. It happened most unfortunately that he still held in his hand the expensive gold-mounted stick which he had seized from the gentleman in the Strand, and clung to half-unconsciously afterwards. It had the name of the owner upon it; and as poor Bethell was marched away by the officer of the law, the enemy Dee strode past him to the goal. By the way, it has been calculated that the total loss caused to London by a full day's fog is one hundred and fifty thousand pounds. It is estimated that the special measures that have to be taken by the railway companies cost them six thousand pounds, and that the cabmen collectively lose one thousand pounds.

* * *

People all over the country must have viewed with interest the great demonstration of enterprise and activity in the theatrical world of London at the beginning of the present autumn season; for what is the gain of the people of the Metropolis in this matter to-day is that of the provincial a little while later, when the success of the London production is assured, and excellent copies of it are then circulated through the country. Not for some time past do we remember the season of theatrical entertainment to have been opened with so much real force, not merely in the number of new plays—though that has been prodigious, and at one time there were too many *premières* for nights of the week — but in their general quality; and even people who make no affectation of prudery do not conceal their satisfaction that the tone is healthier than it used to be. It is suggested that at one time the London and provincial publics did evince a fancy for problem-plays of a grosser sort; but they soon indicated that there was a limit to their appetite in this direction, and it begins to appear now that tastes have turned. The other evening in one of the leading variety-houses a newly engaged artiste of great reputation sang a song with a thinly hidden double meaning, and when it was ended the audience remained icily mute. Then the performer recited a pretty little ditty of a sweet and innocent domestic character, a child-and-daddy story, and the people cheered vigorously, and the more vigorously to indicate why they did not cheer at all before. It is said that a great outburst of literary activity is often the precursor of the fall of an empire, and we suppose that literature in this matter may be taken to include the drama. But though there are some people who would like to discover some moral hanging on to the present state of things, or account for it in some way, no such pessimism as this is possible. It is simply an interesting fact that at a time when every man you meet is complaining about the hard times, the severity with which he has to limit his personal expenditure, the details of the much smaller house than that he lives in at the moment to which he is shortly moving, and the scrap-iron price that he got for his motor-car when he sold it—at this time there is more money for the theatres than ever there was, and playwrights and managers who can offer to the public something really good are sure of a handsome reward—surer, perhaps, than any one else in the world. It was estimated lately that at one time seats to the value of fifty thousand pounds had been booked in advance at West End theatres. It is an adventurous business; a great courage is needed, and the adventurers must be prepared for failure. But there are many playwrights making great incomes in these days. It is said that Mr J. M. Barrie, who has a new one out this autumn, has already made about one hundred thousand pounds from his plays. Sir W. S. Gilbert made fifty thousand pounds from *Pygmalion and Galatea* alone, and Mr Pinero made forty thousand pounds from *Sweet Lavender*. It is generally reckoned that a successful play—not a brilliantly successful one, but a play that has just a good run — is worth ten thousand pounds to its author; and as there are only about eight thousand words in the average work, this represents a very excellent rate of remuneration. But think of the money that a popular play draws from the public, and what the profits must be! It is said that *The Silver King* has drawn more than six millions sterling! This was the late Mr Wilson Barrett's estimate of gross takings. *Rip Van Winkle* is supposed to have made a profit of over a million, and *Charley's Aunt* half that sum. *The Private Secretary* earned one hundred and forty thousand pounds for Mr Penley; and *Sweet Lavender*, which, as we have seen, did so well for its author, did even better for its producer, Mr Edward Terry, who cleared sixty thousand pounds out of it. And there are plays to-day that are doing and will do nearly or quite as well as some of these, although competition is so much severer than it used to be, and a much greater diversity of attraction is offered to the public than a couple of decades back. There

are more failures now than there used to be, and the cost is greater and the risks more frightening; but the rewards for great merit are waiting just as before. Nearly a year since it was calculated that sixty thousand pounds had been paid in royalties to the composer of that wonderful success of the time, *The Merry Widow*, and forty thousand pounds to the librettists; and that the Viennese music-publisher Herzmansky had up to that time made seventy thousand pounds profit out of the publication of the musical score! And this musical play is still going strongly. It is, indeed, a big business in these days. Lately a good authority in Mr Seymour Hicks was giving us some interesting figures of an ordinary sort of theatrical budget. He said that an average West End theatre when full is worth to the box-office about two hundred and eighty pounds. If the play is a big success this is taken eight times a week, resulting in two thousand two hundred and forty pounds being taken. From this amount an average of one thousand two hundred pounds may be deducted for current expenses, leaving a profit balance of one thousand and forty pounds, from which, however, the initial cost of production has gradually to be recovered. In an ordinary way, everything will be cleared in a few weeks' time, and thenceforth the management will view with increasing satisfaction the continuation of the weekly profit of a thousand and few odd pounds.

THE UNBIDDEN GUEST.

JEAN DUPONT looked at the garden with anger and regret. At this hour of sunset — when the heat of an August day was turned to the slumbering quiet of evening, when the slanting sun lit up the valley with soft tones, and the woods and ravines were already sunk in sleep and twilight—the garden should have looked its best, the roses sending out a gentle fragrance to the air, and the long shadows on the grass lying softly on the velvet green, while the geraniums, the dahlias, and the spear-like heads of the foxgloves took on a darker hue, more attuned to the hour of the Angelus. But the lawn was cut about out of all recognition, the flower-beds were trampled on, and branches of the fruit-trees lay about, torn off in pure stupidness, for the fruit was far from ripe.

So this was war! Jean would not easily forget the night that was past. Far through the summer darkness into the early dawn soldiers had passed the house, silent, dusty, and ragged, pressing onwards with a look of shame, a burning anger. He had stood all night at the gate and watched. Few had stopped; few had spoken to him; and he, for his part, had asked no questions. If any demanded food and drink he gave what the house could offer, for so madame had bidden him. Once when a company of dragoons had passed he recognised the uniform, though it was ragged and very different from what he had ever seen it before, even when monsieur had come back from a day's manœuvring. So he had stepped out from the gate and stopped an officer. Could the captain inform him, he asked, whether Major de Coutelan would be passing that way during the night? This was his regiment, the officer had answered, but he would not pass that way or any other; he was behind, on the field of Wörth, dead—for the country; and, so saying, he had galloped on to join his company on the road through the Vosges.

First Jean had thought it best to go immediately and tell madame that her husband was dead; then he had decided it could well wait till morning. There was no good to be done by hurrying these things; the news of death always came soon enough, however late one put it off. And so he had rolled a cigarette and smoked, sitting in the roadway by the gate and watching the stream go by. Towards dawn the hurrying crowd had thinned, and after about four o'clock no more soldiers had passed. Jean had had the valley to himself, and the silent Vosges, rising and rolling up into the distance, shimmering and blurred in the morning mist.

Major de Coutelan had been a pleasant master, always promising to find him a good occupation in life when he should be old enough. A fine soldier too, it was said, and one whom the Emperor had noticed. Had he not himself pinned the Cross of Honour to the Major's breast? Jean had often thought he would like to be a soldier himself; one would then get so much more spice from life than when just tending the garden and driving madame and mademoiselle in the pony-cart. Not a conscript, to do a year or two of soldiering and then back to the garden; but a real soldier like Sergeant Moreau at Orleans, who gave fencing-lessons, and was so full of stories of the army. He wondered if the sergeant was killed, or if he too rode with head bent through the night. Of course this battle of Wörth would be revenged, and France and the Emperor would drive the Germans back, and then follow them into their own country across the Rhine. He was not sorry for the Major. It was much better to die in the rush and excitement of battle, where death came swiftly and with no pain, than to die in bed. And dying for the country—that was something glorious, something to be remembered in one's village. He could recall how Georges, the son of old Marie, who kept the 'Vache Noire,' up by the church, at the end of the main street, had been killed at Magenta, though that was when he was a very little boy; and how the curé had preached on the love of one's country. Old Marie had always

seemed proud and glad that Georges should so have died; but then she had five children, so that there were four left. It was different with madame and mademoiselle. They would be left alone now; it was very different for a woman to be alone than for a man. Still, they would go back to the Loire, to the château near Orleans, in his own village of Vampes, and little by little they would become used to the Major's death. Jean had never liked the idea of coming to Alsace, and of taking this house on the slopes of the Vosges, simply to be near the Major at Strasbourg; and with the war it was no place for women. But it was madame's wish, and even with the beginning of the fighting she would not go back to the Loire. There were no men about the place now but himself; he was only just sixteen, but then he was tall and strong, and did a man's work easily. He must look carefully after the women-folk, and keep them from any danger. Monsieur de Coutelan would expect that, and now that he was dead the duty became the more compelling. Besides, he was not sorry to have some definite duty when so many of his friends were with the army in real danger and in the midst of desperate fighting.

The morning was wearing on and the sun getting up; he had better go into the house and tell madame that her husband was dead. That was not easy. Perhaps it would be better to tell one of the women-servants, and let her break it to the mother and daughter. No; that smacked of cowardice. He was the only man in the house, and must not begin by shirking an unpleasant task.

So he had gone into the house in the first freshness of the summer morning. He had found the other servants already about, doing their everyday business with white, scared faces. What had he seen? What had he heard? they had asked him. But he told them simply that he had stood at the gate and watched the press of men go by; that he had gained no information. It was better, he had thought, not to tell them of the master's death; they would only make a noise and frighten madame. It was much better that she should know quietly and in private. So he had escaped their questioning and made his way to the bedroom.

Madame had at once opened the door to his knock; she was fully dressed, and very white and tired. She looked as if she had spent the night in praying. Mademoiselle was sitting by the window, a slim, mournful figure, the morning sunlight touching her black hair and lighting the pallor of her face. She looked very beautiful, more beautiful even than she had seemed to him before; and the pride of her bearing, which had always made him ill at ease in her presence, seemed gone away. For the first time since the officer had given him the news Jean had felt frightened. His message had suddenly grown so bald, and these two watching women so frail and lonely!

'What news have you?' madame had asked him, and her voice was still and strained.

'I stopped an officer of the dragoons, and he told me the master is dead, back there on the battlefield,' Jean had blurted out, not knowing how to put it, and wishing his message were anything but that.

Madame had not spoken; she had simply drawn herself up, her hands clasped and her head thrown back. It had been as if Jean had hit her a blow in the face. Mademoiselle had not moved or spoken, but had sat as he first saw her, the sunlight on her hair, the same unquiet look, the same uneasy poise. He had remained by the door longing to tell them that he would do all he could, give all he had, to keep them from harm, yet not daring to break in on their silent grief.

'When was it?' madame had asked in an even, expressionless voice; and when he had told her 'Early in the battle,' 'Ah!' she had said, and turned slowly to mademoiselle. And he, glad of the opportunity, had made his escape.

Jean had gone down to the kitchen then, and taken the bowl of coffee and the lump of bread that had formed his morning meal since he had worked for the De Coutelans; for before that one did not drink coffee—at least not much, not every day; it was expensive. He had told the cook his message. She had known it all along, she said; she had been sure from the beginning that this move into Alsace would bring nothing but ill-fortune to the family. Now they were a houseful of lonely women, with not a man to look after them. Jean had thought of telling her that when the Major was alive but with the army he could not very well look after them, so his death but little affected their position; but long experience of the cook had told him that it was better to let her have her own way. She was sorry at the master's death, he knew well; but she would like above all things to blame him for an ignorant and conceited boy by way of hiding her feelings. So he had left the kitchen and gone out to his work in the garden.

He had worked with more than usual vigour; but, no matter how careful had been his attention to the garden, his thoughts had wandered back to the night and the retreating army, and then again to the two women in their silent mourning. It was with something of relief that he had heard the sound of horses' hoofs at a distance down the road to Wörth. He had run to the gate, fearful lest it might be men bringing back the body of the Major; and then, remembering that soldiers in war-time had other things to do than bring back the dead to their relatives, he had thought scorn of himself for an ignorant boy full of child's terrors.

The soldiers turned the bend at the bottom of the hill and slowed their horses down to a walk as they came up the rise. Jean had not been able to distinguish the uniform at the distance, but had noticed lance-points gleaming in the sun. As they came nearer he had seen the uniforms more clearly; but they were not like any he had seen before, and the men themselves looked different from the soldiers that he knew. And then the officer who was riding at the head of the troop turned and shouted some-

thing to a sergeant riding at the rear, and Jean had known that these were Germans. He had been frightened; there was no doubt about it this time, he had been really gripped by fear. All sorts of tales about the cruelty of soldiers in war-time had come into his head, and he had badly wanted to run; but the thought of mademoiselle had come to him, and—he was glad to think of it now—he had not even hidden behind the gate-post.

Jean had carefully taken stock of the officer as he rode up. He was a biggish man, fair, and rather inclined to be fat, though he looked very young—almost as young as Jean himself; he had little eyes that stuck out rather far from his head, a large, loose-lipped mouth, with a slight, fair moustache on his upper lip.

'Holà, there, boy!' he had shouted to Jean when the troop had come up to the gate; 'is there any one in this house, or have they all scurried off like rabbits?' He had laughed himself at this, and the troop had joined in with a guffaw.

'The house is full,' Jean had replied; 'and we have no corn left for your horses, for we gave it all last night.'

'Look here, my fine fellow,' the officer had continued, 'I'm not here to waste my time listening to your tales. Who lives in the house? How many are there? Sharply!'

'Madame and Mademoiselle de Coutelan, three women-servants, and myself,' Jean had answered.

'And the stables—for how many horses is there stabling?' the officer had queried in the same important, rather squeaky voice with the heavy German accent.—'But there is, I see, a decentish-sized garden. I think it will do, eh, sergeant?'

'It looks well enough, sir,' the sergeant had answered.

Then the lieutenant had turned again to Jean and told him to inform his mistress that she might prepare for company. He would sleep that night at the house, and would expect something to eat. Meanwhile, he would leave five men to prepare for the evening. 'In these troublous times,' he had finished, 'it is just as well that lonely women should have men to look after them.' And the troop had laughed loud at their lieutenant's wit.

Jean had protested that the house could not support so many men, that there was no corn in the stables, that madame and mademoiselle were in great grief—Major de Coutelan having been killed in the battle—and that it was no time to receive strangers. The lieutenant had only sworn at him, and ordered him sharply to take his message. Then he had given some orders in German to five of the troop, of whom one was the sergeant, and trotted off up the hill with the remainder.

During the day little had happened. The Germans were not bad fellows, and had kept out of the way of the household. Except that, there not being room in the stables, they had tethered their horses on the lawn and so spoilt all the work Jean had given to it since the family came to Alsace, and that they had taken what fruit they wanted and sometimes branch as well as fruit, they had behaved with consideration and a marked respect for the cook's tongue. Madame and mademoiselle had not appeared all day, but remained shut in the bedroom. Jean had passed the day with nothing much to do, but with a certain interest in watching the Germans cooking their food and tending their horses, and in listening to the sergeant, who seemed a pleasant fellow, though gruff and blunt of speech.

After the evening meal Jean had come out into the garden to await the lieutenant's return, with sorrow turned to anger against the Germans in his heart. About seven o'clock there was a noise of horses on the road, and the lieutenant came back with ten troopers. They were dusty and hot, and all looked none too pleased with life. The officer, having curtly given his orders, and told the sergeant to see that his horse was properly tended, swaggered into the house, calling loudly for his supper. Jean brought him a message from the cook that if he wished a good meal he must wait half-an-hour; meals did not stand ready at all hours of the day awaiting every stranger's good pleasure. This message Jean delivered, though he had taken leave to alter somewhat the wording. The lieutenant received it sourly, and announced that he would walk in the garden till the food was cooked.

There were lettuces to be cut and fruit to be picked, so Jean had gone out to the kitchen-garden, where he got a sight of the officer pacing the gravel terrace behind the house, his sword scraping and clanking, and a thin blue cloud of cigar-smoke hanging about his head. Though Jean had conceived a great dislike for the man on account of his overbearing manner, he was struck by the fine martial figure that the German cut in the fast-falling light. Well set up, though inclining to stoutness, the smart uniform of a Uhlan regiment fitting to a nicety, the officer impressed on Jean the power of this enemy that was now walking the soil of France.

As the lieutenant came to the end of the terrace and was turning about to retrace his steps, mademoiselle came round the end of the house, stepping almost into the man's arms. Jean saw the soldier click his heels smartly together in the most precise of military salutes, at the same time bowing with something of an exaggeration of deference. Though hidden by bushes, from where he was Jean could see the two figures plainly outlined against the western sky, the voices carrying with distinctness across the few yards that separated them from him.

'Good-evening, mademoiselle,' said the German; 'it is a pleasant hour for the garden—the best hour of the day, to my thinking.'

'Good-evening, monsieur,' mademoiselle replied, and made as if to move on.

But the lieutenant stepped to her side, and, with a wave of the arm, said, 'Surely it is just the

time to walk on this terrace. You can teach me the beauties of your flowers. I will prove myself an excellent pupil, I assure you.'

'Thank you, monsieur, but I have no wish for such amusement this evening. You must know that my father was killed in the battle yesterday. You can understand, then, that I am not wishful for company. Though perhaps it seems strange to you, who are a soldier, I cannot forget that you are of the side that killed him, and would, therefore, that you excuse my company to-night,' said she, and stepped on with a bow.

'Mademoiselle, I am sure you make a mistake,' replied the lieutenant. 'You would do much better to forget your grief a little while. Besides, I am not bad company, or so my girl-friends have given me to understand. Be persuaded, and take a turn with me. You are told to forgive your enemies, you know. Come, take pity on my loneliness. I promise that you will not regret it.'

'Monsieur,' the girl answered, the disdain that Jean knew so well ringing in her voice, 'I have asked you to excuse my company. Good-night.'

'Come now, my dear,' said the lieutenant—and his voice had taken a light, insolent tone—'there is no need to be angry. A girl always finds some pleasure in a man's society, especially if he wears a sword, and you are no exception to the others, I'll warrant. Away with that feint of anger. I know your sex, I tell you. Still, I'll find a reading for the flowers that will please you, though you are no lover of botany. Come now, that's a bargain!'

'Monsieur,' mademoiselle answered, 'you bear an officer's uniform, and so I imagine you have met some few gentlemen among your fellows. Try to recall the manners of these. It is sometimes good to imitate even where one cannot reproduce. In time, I think, you might make a passable caricature of courtesy that would meet with much approval from the friends that you have mentioned. Good-night, monsieur;' and with a sweep of her dress and a slight emphasis on the last word, mademoiselle passed into the house.

Jean saw the lieutenant gnaw his moustache and turn angrily away; yet the man made no effort to apologise, but walked up the terrace with every appearance of conceit. He must have his dinner, Jean thought, and that quickly, so that he might be got out of the way of again meeting mademoiselle as soon as might be; but if such a chance-meeting should again occur, then it must be the servant's business to teach this man the manners that he lacked. So Jean had stepped on to the terrace and announced that dinner was served.

He waited on the lieutenant as he had been taught a servant always should, quietly and with every readiness to anticipate his wants; but there was a great desire in his heart to refuse to serve the man. And when he thought of the conversation on the terrace he was ready to strike the officer on the face. He noticed that the wine went freely, but the lieutenant preserved an air of sullen ill-temper, coupled with the assumption of an added swagger.

When the meal was finished the lieutenant lit a cigar and pushed back his chair, stretching his legs out and blowing smoke-rings to the ceiling. Jean could see his face was red; after the hard exercise of the day the wine had gone quickly to his head. He was already a little muddled, on the road to being drunk. The lieutenant drunk, Jean thought, would probably be easier to deal with and less overbearing than when sober. So when the German moved to the arm-chair, and in the short passage from the table to the side of the fireplace showed himself not altogether master of his legs, Jean promptly carried out his order for another bottle, and stepped through the long, open windows on to the terrace.

It was cooler and quieter in the garden. A full moon shone peacefully on the scene, showing the soldiers lounging about on the ground, smoking, and talking together in low voices. The tread of a sentry came from the road on the other side of the house, the sound carrying distinct and sharp on the still summer night. Jean could also make out the form of another soldier standing silent by the brook beyond the rose-beds. He could see no horses, and imagined that they must be tethered in front on the little lawn by the stable entrance. He looked up at the window of madame's room; it was lighted and wide open, but the blind was drawn down. The next window—mademoiselle's—was dark; so the two women must be in the same room. Down below among the Germans he would watch over mademoiselle, and she would not know it. It was better that way. He could show all his devotion; he might put into action his love, though he was almost afraid of that word; and there would be no chance of his forgetting his place, and being checked by that proud manner that he was so afraid of, which yet made the woman so much more beautiful and so different from all the others he had seen. It was easy to carry out a duty that was so much what he would have chosen it to be. But a great shouting from the lieutenant upset his thoughts and brought him into the dining-room.

'Here, boy! Confound the fellow! where is he got to? Boy, come here, you fool!' And, as Jean hurried into the room, 'Here, you clod! do you think I'm going to spend the night calling for you? Why don't you come when you're wanted? Show me my room, and hurry up about it. Remember I'll have my orders obeyed, and none of your long faces and surly looks here.'

His face was red and puffy, his eyes bright and staring. Drunk he was, without doubt, but his senses were mainly with him still, though wandering and excited.

'The rooms are all full upstairs, monsieur; but I will make you a bed in here or in one of the other rooms downstairs,' Jean answered.

'Full! Then let them empty themselves. I'll sleep in a bed this night, or I'll wring your neck, boy!' and the lieutenant swore loudly.

'You can have my bed, monsieur. I sleep over the stables. I tell you the other rooms are full.' Jean felt his anger mounting, and a desire growing to show this man better manners, and to teach him to make less noise and not disturb the whole house.

The lieutenant's face became purple and he sprang from the chair.

'*Gott*,' he stuttered, 'but he offers me his bed! His bed to a German officer! Listen! I'll give you one more chance before I thrash the life out of you. Arrange how you will, it matters nothing to me; but sleep in a bed I will—not in a garret, but a bed. If you do not get my room ready in five minutes from now—five minutes, you hear—I'll settle you first, my fine young garden-boy, and then I'll make a visit upstairs and pick my room. I dare say your young mistress would prefer to sleep alone, but she may have to accept my company if you don't obey. Now, get out!'

Jean had gone white; he felt a curious pricking of the skin under his hair and a tight feeling in his throat. He drew himself up. There was only one thing to do: send those last words down the lieutenant's mouth and his teeth with them. He was about to spring and strike, when the door opened and mademoiselle herself appeared in the doorway. It was a slight, tall girl that stood there, arrayed in a clinging black dress that showed off the graceful lines of her figure, the head thrown slightly back, the full throat gleaming white through a collar of lace-work, the dark mass of hair flinging into relief the pallor and haughtiness of the face.

With eyebrows slightly raised and a surprised look in her eyes, mademoiselle asked, 'Jean, what is all this noise about? I trust that you have not forgotten to make this gentleman in every way comfortable. Remember that, though unbidden, he is a guest in our house, and so entitled to all that we can give him.' And then, turning to the lieutenant, who had been staring stupidly, 'What is it that you require, sir? We are only women in the house, except the good Jean here; but what we can do to make you comfortable shall be done gladly.'

Jean was standing between the door and the lieutenant, his right hand touching a chair on which lay the lieutenant's sword-belt and revolver. He neither moved nor answered; he had taken one look at mademoiselle as she entered, and then his eyes fixed themselves on the man's face. The lieutenant had merely stared stupidly when the door had opened, but now there was a look on his face that Jean had seen on other men before. That look must never find expression in word or act. If it did—— Jean's right hand felt for the revolver and his fingers closed round the butt.

The lieutenant took a step forward, with a smile and a deep bow. 'Mademoiselle,' said he, 'I am very sorry that there has been any noise; still, I cannot blame it, since it has again brought me the pleasure of your company.' He paused, but mademoiselle's look was of icy surprise, and Jean remained rigid. 'The truth is, I was asking for a bed—a man must have a bed, you know, young lady—and this fellow here refused, or offered me his own, which is the same thing. I suggested that you might be willing to offer me yours.' Mademoiselle shivered. 'But I do not wish to be unpleasant to a lady. I will forgo any talk of such things if in return you will give me one kiss—one kiss for a bed—that's fair, eh?'

And the lieutenant stepped forward, his eyes gleaming, his arms stretched out. Mademoiselle stepped back with a low cry. It was then Jean fired. Through the smoke he saw the lieutenant stop; the drink and passion went out of his face, a sort of questioning wonder coming in their place, his arms bent towards his chest. The man swayed, took a half-step forward, then fell heavily on his face and lay still. Instantly, it seemed to Jean, the room was filled with soldiers. The sergeant was down on his knees by the body. Madame and the women-servants came hurrying into the room. Then men seized Jean and tore the revolver from his hands. Every one was talking, and the servants whimpering and trembling. Madame went to her daughter and stood with an arm about her.

Jean did not move. He did not seem interested in the proceedings, only a great gladness filled him that the lieutenant was dead. Then he heard mademoiselle speaking. 'The man insulted me; my servant fired and killed him. He cannot be blamed. He has but carried out his duty. You would not punish him for that?'

It was good to hear that! It did not matter what happened to him now, Jean felt. He had saved mademoiselle from insult, and she was pleading against his punishment. Then the sergeant stood up from beside the body and spoke calmly, as if these affairs might occur any day.

'Ladies, I much regret that this should have happened. I am afraid that Lieutenant Waldstein was drunk; but a German officer has been murdered, and your servant will have to pay the penalty. I will remove my men from your house, or, if you will, escort you to Wörth and put you in safety there. But I shall shoot this boy. There is no other way.'

Mademoiselle had then pleaded for his life. He was young, and had acted on the impulse of the moment. He had done his duty, and had saved her from insult and harm in her own house. Jean got all his reward while she was there asking his life. Not that he wanted life; he could die so well now, when all had been brought to a fitting finish. Besides, it was not right that mademoiselle, who was of high family, should thus plead for a servant.

So, trying hard that his voice should not shake, he said, 'Mademoiselle, it will be as the sergeant says. Do not waste time on me, but go and

get ready to leave for Wörth, where you will be in safety. I am sorry that I cannot go with you, but I am glad of what I did. If I could have killed him before he spoke I should have been more glad. Good-bye, madame. Good-bye, mademoiselle.'

Then mademoiselle turned to the sergeant and begged him, with a sob in her voice, for Jean's life; but he refused with few words. So she had come across to Jean, and stood a little while with her hands on his shoulders and the tears running down her face; then she stooped and kissed him on the forehead.

Jean died where there is a little space of wall between the stable-gate and the laurel-bushes. They buried him where the pine-trees at the side of the house look out over the valley. The moon was full, and the night soft and calm, and a light wind among the trees went sighing up the slopes of the Vosges away into France.

SAVING THE CHILDREN.

THE past sixty years have been fruitful of public and private effort to save orphan and destitute children from sinking in the social scale and pursuing careers of vice and crime. Parliament has passed many beneficial Acts, and never was there more voluntary effort; while the founding of Ragged and Industrial Schools, Dr Barnardo's Homes, and those of George Müller and William Quarrier, is a creditable record for our common humanity. Much, no doubt, remains to be done, for, as G. R. Sims says, 'we must take no rest, and give the country no rest, till every child—orphan, destitute, diseased, oppressed, afflicted—has not only food and clothing, but Christian love and Christian home-life.' The publication of *Memoirs of the late Dr Barnardo*, by Mrs Barnardo and James Marchant, with an introduction by Dr W. Robertson Nicoll (Hodder & Stoughton), affords an opportunity to say something on this important subject.

Thomas John Barnardo was born at Dublin, July 4, 1845. His father's family was of Spanish origin; his mother, who belonged to an old Quaker family—the Drinkwaters—was a woman of great strength of character and deep religious convictions. As a boy Barnardo was full of fun, mischief, and exuberance of life; was somewhat thoughtless and careless also; and gave trouble to his teachers. He had abundance of ability; lessons gave him little trouble. Never fond of sports, his favourite hobby was reading. On leaving school he spent a little time in a merchant's office. At the age of sixteen he decided, as David Livingstone also did, to train as a medical missionary for China. Neither was destined to carry out his youthful plans. Barnardo attended for a time the theological class of Mr Grattan Guinness, came to London in 1866, and became a student in the London Hospital.

While at his books the call to do something to mitigate the misery and misfortune of the poor children of the East End of London proved to him a more powerful magnet than even the foreign mission-field. Gradually the expulsive power of this new affection drove out the other. Though he 'kept his terms, he did not reach his goal.' John Ruskin, in turning his back on his old early love, the study of art and architecture, for the sake of social problems, wrote in 1871: 'I simply cannot paint, nor read, nor look at minerals, nor do anything else that I like; and the very light of the morning sky—when there is any, which is seldom nowadays near London—has become hateful to me, because of the misery that I know of, and see signs of where I know it not, which no imagination can interpret too bitterly.' Ruskin became a social reformer and enriched the world with some inspiring and eloquent, even prophetic, books. Barnardo found his way also. Early in his career he said, 'I am set primarily for the saving of the children.' With a warm heart, red-hot earnestness, and wonderful genius in organisation, as Dr Nicoll says, 'in a world of talkers, Dr Barnardo determined to do all he could for the miserable and the weak so long as he could, and this is the story of his life.' During a working career of over forty years the public gave him three and a quarter millions sterling to use in saving human wreckage amongst boys and girls. He was happy in his work, which he would not have exchanged for that of any other sphere.

As a young man he was distinguished for energy and enthusiasm. 'The head and face indicated capacity, being that of a thoughtful, resolute, obstinately persevering man.' He did mission and ragged school work; and we have the prophecy of his future career when, in 1868, he engaged two four-roomed houses in a retired court on the confines of the parishes of Stepney and Limehouse; Hope Place being the first permanent home of his mission Sunday school and boys' evening school. During the cholera epidemic of 1866 Barnardo got to know the poor people in a way he could not otherwise have done, and was as faithful as was young Dr John Brown at Chatham during the same period. He attended as many as sixteen deaths in one day, and only youth, enthusiasm, and good health carried him safely through.

There were several factors which helped Barnardo in his decision to remain in this country. Lord Shaftesbury urged him to give up his whole life to the rescue of waif children. Then there came a gift of one thousand pounds from Mr Samuel Smith, M.P., for the establishment of a Home for waif and stray children in East London; and a successful public address Barnardo gave in the Agricultural

Hall still further helped to confirm his purpose. The discovery of his first street-arab did as much as anything else to point the way, for this lad led Barnardo to a lair where eleven waifs of ages from nine to eighteen were seen sleeping in all positions in gutters and on iron roofs, clad in rags. 'Often since,' he writes, 'amid scenes of comfort, I have seen before me the upturned piteous faces of these eleven outcast boys, realised their awful misery and destitution, heard their mute appeal for assistance, and afresh registered in my own heart the resolve to devote my future life to their rescue and training.'

The country was awakening to the condition of the children when Barnardo began his work. Laws were being made and unmade for their protection. Lord Shaftesbury's beneficent labours were beginning to bear fruit. And so the boys' lodging-house at 18 Stepney Causeway took root and prospered. A tent-mission held in 1872 in the East End resulted in some four thousand temperance pledges being taken, two public-houses were closed, and the 'Edinburgh Castle' gin-palace, forced to capitulate, was purchased and transformed into a mission church and coffee-palace. Barnardo kept it as attractive as it had been aforetime; for 'the publican understands human nature; he adopts what are supposed to be common-sense methods of attracting custom.' It paid as a commercial undertaking, and for thirteen years Barnardo was here preaching two or three times a week. There were games and newspapers and temperance refreshments, with social intercourse. The place was rebuilt at a cost of eight thousand pounds, with a hall seated for three thousand two hundred people, and was opened by Lord Shaftesbury.

No destitute child was ever turned away from any of the hundred Homes and branches which were eventually organised. Barnardo was always in need of money, as those well knew who read his printed appeals. Unlike William Quarrier or George Müller, who never anticipated their income, he actually incurred a debt of about two hundred thousand pounds to acquire land and build property, rather more than half of which has been paid since his death in 1905. In that same year over two hundred thousand pounds was sent in for the Homes, and the work has gone on since without check and even with increased momentum. In 1899 the institution hitherto known as 'East London Juvenile Mission, Dr Barnardo's Homes,' became 'The National Incorporated Association for the Reclamation of Destitute Waif Children, otherwise known as Dr Barnardo's Homes.' The writers of the *Memoirs* are justified in saying: 'Never in the history of the Church or the world has such an organised attempt been made to rescue the destitute from starvation, the suffering from peril, and the down-trodden and cruelly ill-used little ones from their oppressors and tormentors. Never before have the hands of loving sympathy been held out so widely or so effectively to the orphaned and the helpless. Never before has any one man borne so large a share of responsibility in such a cause, and never before were there so many children saved in a single year and placed with their faces heavenwards as our records for 1892 exhibit.'

In his sixtieth year Dr Barnardo wrote that forty of these years had been spent among the children, the wastrel children of the slums, not merely of London but of all the great towns of the kingdom. He had caught thousands, but there were thousands more to catch. Boys and girls had always been fond of him, and he was equally fond of them. To his eye no child, however deformed, was really ugly. 'Sometimes,' he writes, 'I have spent the whole night long in slum streets with only my bull's-eye lantern, traversed horrible courts and alleys, examined tenement-houses and common lodging-houses, spent hours in the market-places and down by the wharves and in the railway stations, and all this without one single catch. At other times I have found quite a shoal of little folk seeking shelter in odd corners to hide from the police; then has come my grand time, although often many of them would be alarmed, dazed, and willing to run off at the least opportunity given.'

At Stepney Home he was scarcely ever in before 3 A.M. He made mistakes, and suffered for them; his life was a hard one, with seldom a holiday. His working day was often about sixteen hours. The salary he received was barely sufficient for his wants; yet he rarely complained and never boasted of what he was doing. This man, so good a servant of the Empire, as Dr Nicoll points out, received no public recognition, and no honours came to him. He was a born leader and organiser, and did everything well — too well, some of his critics and contributors thought. The Village Home for Girls at Barkingside was his peculiar care. Every detail of every cottage, from the foundation to the chimney-pot, the colour of paint and paper, and the furnishing, had his supervision. It was his aim that in these cottages family life and family love should be reproduced. It was only after his happy marriage in 1873 to Miss Elmslie that he received orphan and destitute girls. During the twenty-nine years from the opening until the founder died eight thousand seven hundred children had been received and trained in the Village Homes. The boarding-out system, first adopted by the State in Scotland, and now also adopted in England, had Dr Barnardo's hearty approval. 'I believe,' he said, 'my institutions are as good as any on earth. Of course I do. If I didn't I would make them better; but there is something better, and that is boarding out, if it is well done. Boarding out is better because it is natural instead of artificial.' We learn that in 1906 over four thousand children were boarded out by Barnardo's Homes, the average annual cost for each child being thirteen pounds; babies cost seven shillings per week, and children from two to four years six shillings per week. The Homes being

on a Protestant basis, Dr Barnardo had on various occasions litigation with Roman Catholics, in which he came off successfully, as he did at a crisis in 1877 when a demand was made for an inquiry into his financial and other methods. Dr Barnardo died on the 19th September 1905, and this year a monument fashioned by Mr George Frampton was placed over his tomb. Here are two verses from a tribute by the editor of *Punch*:

> Naked, he clothed them; hungry, gave them food;
> Homeless and sick, a hearth and healing care;
> Led them from haunts where vice and squalor brood
> To gardens clean and fair.
> . . . . . .
> He stooped to save them, set them by his side,
> Breathed conscious life into the still-born soul;
> Taught truth and honour, love and loyal pride,
> Courage and self-control.

The Orphan Homes founded by George Müller at Ashley Down, Bristol, and those founded by William Quarrier at Bridge of Weir, seven miles from Greenock, have an equally beneficent record. Their methods differ from those of the Barnardo Homes in that no public appeal has ever been made for money, their support having depended upon the exercise of faith and prayer on the part of the promoters and voluntary contributions from the public. The story of their inception and the careers of Müller and Quarrier are more interesting than any romance.

It was in 1835 that George Müller, a German pastor resident in England, printed proposals for the establishment of an Orphan Home, which took shape in 1836 at Bristol. As the result of 'prayer to God' he announced that he had up to 1856 received eighty-four thousand four hundred and forty-one pounds on behalf of his orphans, these numbering two hundred and ninety-seven. From the start until last year one million six hundred and thirty-nine thousand eight hundred pounds had thus flowed in to meet the necessities of the twelve thousand four hundred and fifty-three orphans cared for in the Homes over that period.

The record for the Quarrier Homes is quite as remarkable. In the years between 1871, when the first Home was opened, and 1905, upwards of thirteen thousand children were dealt with, five thousand of whom had been sent to Canada. Something like six hundred and seventy thousand pounds was received in voluntary gifts, of which two hundred and seventy thousand pounds has been spent on land and buildings, and four hundred thousand pounds in the maintenance of the Homes and Consumptive Sanatoria. No one is called upon for subscriptions, and no resort is made to bazaars or entertainments. 'The needs are committed to God in prayer.' At the close of the year 1907 there was a company of one thousand four hundred and twenty-seven orphan children, consumptives, and epileptics; for the needs of the sixty-nine Homes forty-five thousand pounds had flowed in, besides food and articles of clothing.

William Quarrier began his public work among the street-boys of Glasgow by the organising of shoeblack and newsboy brigades. From these developed the Orphan Homes which to-day provide a home and Christian training for fourteen hundred fatherless and orphan boys and girls of all ages. The founder was born at Greenock in 1829. His father died when he was three years of age, and Mrs Quarrier removed to Glasgow and supplied the needs of her family by doing needlework. There was a temporary stoppage of work when William Quarrier was seven years of age, and the lad, having been thirty-six hours without food, 'was standing in the High Street, with bare head and feet, pinched with cold and tortured by hunger, wondering that amidst all who crowded by not a soul had a heart to feel for him or a hand to help. There and then the starving child registered the vow that if ever he should have the means to help he would not pass by the destitute children.' He worked for a time in a pin-factory, and finished his apprenticeship to shoemaking at twelve years of age. He became an indefatigable worker in Church and social schemes, and commenced business at twenty-three; and in 1864, when he was thirty-five years of age, his meeting with a ragged and destitute match-boy recalled his vow, and his shoeblack brigade and other social schemes followed. A letter from him to a Glasgow newspaper in 1871 led Mr Thomas Corbett to subscribe two thousand pounds; and this enabled him to begin the work in Glasgow which broadened out to the Homes at Bridge of Weir.

The Orphanage at Aberlour, Banffshire, founded by the Rev. Charles Jupp, its warden and treasurer, was visited by the King on 23rd September 1907. The Canadian railway magnate, Lord Mountstephen, a native of Speyside, close by, has given a donation of ten thousand pounds towards the institution, which has accommodation for four hundred destitute children. An effort is being made to endow beds for the different clans of the Highlands at a cost of three hundred and fifty pounds each. The beds when endowed will be at the disposal of a child nominated by the clan. The Orphanage was founded in 1875 for Episcopalians only; but so many applications were made for others that its doors were thrown open to children of all denominations resident in the United Kingdom. Canon Jupp began, as other pioneers did, in a humble and homely way by taking four boys into his own parsonage, and now the Aberlour Orphanage extends to three blocks of buildings, with schools, swimming-bath, a farm where sixteen to twenty cows are kept, and a market-garden. The farm and market-garden produce yields a profit to the institution. Girls are trained chiefly for domestic service; boys are apprenticed to various trades. Canon Jupp has been unweariedly earnest in the interests of this Orphanage, has never taken a holiday, and since 1883 has collected twenty-five thousand pounds towards its maintenance and extension. A monthly

magazine is issued. Aberlour Orphanage, which has done and is doing a noble work, depends entirely on voluntary contributions.

The Children's Home and Orphanage, Bonner Road, London, with its dozen branches in various parts of the kingdom, cares for one thousand eight hundred orphans and crippled or afflicted children. It has done excellent work during the thirty-eight years of its existence, and has sent about two thousand boys and girls to Canada. Last year the number sent was about one hundred and sixty, all of whom found good situations. It is proposed that the headquarters of this Orphanage shall be at Harpenden, where an estate has been purchased. Thousands of children have been saved from vice and poverty, and from falling into criminal ways, by the aid of this Orphanage.

Mr J. W. C. Fegan began a work for the rescue of waifs and strays in south-east London, first at Deptford and then at Southwark, in connection with which an orphanage was founded at Ramsgate, and later another at Stony Stratford. The cost of sheltering, feeding, clothing, educating, and teaching a lad a trade in this Home is sixteen pounds a year; the cost of maintaining a boy at the Orphanage and Training Home at Stony Stratford is fifteen pounds a year.

The movement in 1847 which culminated in the founding of the Edinburgh Original Ragged Industrial Schools was the outcome of the interest awakened on behalf of the poor, helpless, neglected children of Edinburgh by the publication of Dr Guthrie's *Plea for Ragged Schools*. Between seventy and eighty girls are accommodated at the girls' school at Gilmerton, and two hundred boys at the Liberton school. There have been excellent and encouraging results since the start at Ramsay Lane, Castle Hill, Edinburgh, and the schools never did better work than they are doing to-day.

If the truest national wealth consists of human life, then those who have increased its power and conserved what might have been a waste product deserve well of their country. Sir John Gorst, in his *Children of the Nation*, remarks that there are some folks whom society has got to pay for either at the beginning or end of their lives, and that it is much cheaper at the beginning. And, further, the work of the State as compared with the work of private individuals has proved a lamentable failure. It is on record that, in the case of one London workhouse, of the eighty girls who had gone out to service every one went to the streets. The chief cause of this failure is the absence from State institutions of that special individual love which nature implants in a mother. It is this special individual love of the father and mother, and the training given to orphans and the destitute through the institutions founded by Dr Barnardo, William Quarrier, Dr Guthrie, and others, which have saved thousands from growing up a burden and curse to society, and made them instead a valuable and useful asset to the Empire.

THE MONTH: SCIENCE AND ARTS.

A SHORTHAND TYPEWRITER.

AMONG the numerous endeavours that have been made to expedite, facilitate, and simplify the transaction of correspondence in the office, the evolution of some mechanical means of writing in shorthand has claimed particular attention. Up to the present, however, no practical success has been achieved, a result due to the extreme difficulty in recording the necessary signs incidental to any system of phonography. Now, however, a simple machine, the 'stenotyper,' has been devised, in which the problem has been completely surmounted. True, it involves the committal to memory of a new stenographic alphabet; but this is of such an easy character that it can be mastered within a few hours, so that speed of manipulation is only a matter of practice. By its aid, however, even the most rapid speaker can be recorded verbatim without effort; and, what is of far greater importance, the report thus obtained can be transcribed by any person familiar with the particular alphabet. The machine and system is a marvel of ingenuity, comprising what appears to be a diminutive typewriter, printing but six characters, while the machine itself consists of only sixteen working parts—nothing to get out of order—and, being of substantial construction, can be subjected to the roughest usage without any apprehensions as to damage. There are only six keys, and the characters are similar to an abbreviated Morse code, being a combination of one long dash, two short dashes (upper and lower positions), and one double short dash, together with a single and a double dot. By the combination of these six characters every word in the English language can be legibly written. The keyboard is so arranged that on either side of the centre the three characters are the same for each hand, this being done so that each hand can have, in conjunction with the three central keys, full command of the alphabet. The hands can thus be used alternately, one hand always going down while the other is coming up. By this means the speed of manipulation is practically doubled, and the ease of writing considerably accentuated. Each time a key is depressed a full line of that particular letter strikes the inking-ribbon, but only the one letter prints which strikes the paper where there is a solid anvil or backing-block above it, since the inking-ribbon will only print when brought sharply into contact with the paper, and

as the paper has no backing except at the precise point where the letter should be imprinted, the remaining letters in the line do not print. The backing-anvil moves on a spiral, causing a new backing-block to be brought into position to the right of the letter immediately preceding, this operation continuing right across the page until, when the limit is reached on the right-hand side, the first anvil on the opposite side of the paper comes into position ready for commencing the following line. Between each word a space is made as in typewriting. The paper is carried on a continuous roll, and moves automatically forward upon the conclusion of a line. The result is that when operating the stenotypist has nothing to do but watch the speaker, the scientific disposition of the keys being such that the fingers instinctively depress the correct keys. The usual system of abbreviation so often followed in longhand is adopted, the unimportant parts of a word being omitted; while, as in advanced phonography, a system of phrasing can be practised. To the busy office the machine is an indispensable acquisition, as one stenotypist can be retained, if desired, solely for dictation purposes, tearing off from time to time the letters or notes, and distributing them among the typewriting staff for transcription. The result is that in an extensive business all correspondence can be handled and completed within a very short space of time with the minimum of trouble and without interrupting any other typewriting work that may be in progress.

ELECTRICITY IN THE HOME.

One of the latest developments in regard to the application of electricity has been its adaptation to the fulfilment of several little domestic duties of an irksome nature. Generally speaking, electric current is now so readily obtainable that its extension in this direction is of distinct advantage. The housewife, instead of wasting physical effort in the manipulation of her sewing-machine, can have a small quarter or half horse-power, occupying only a few inches of space, mounted under the table and connected to the electric wiring system of the building by a plug and short length of flexible wire. A switch mounted on the face of the machine enables her to start and stop it when desired with the minimum of effort. The revolving knife-cleaner can be driven in the same manner. Toast and other cooked dishes can be maintained in the requisite heated condition on the table by small and suitable electric vessels connected by flexible cord to the holder of a lamp. Even in the kitchen cooking can be carried out with the maximum of comfort by the aid of electric ovens, boilers, broilers, grillers, and so forth, since no heated fumes are dissipated in the room, and the degree of heat can be more delicately controlled than by either gas or coal-fires. For the preparation of dishes which must be cooked only for a certain period, automatic arrangements can be incorporated which either remove the edible from the vessel upon the expiration of the prescribed time, or the current is switched off, thereby obviating any possibility of the article being spoiled through inadvertence or forgetfulness on the part of the cook. In the boudoir my lady's curling-tongs can be quickly and safely heated to the fine degree desired, while my lord need not search for elusive matches, the mere picking up of the electric lighter automatically causing the apparatus to assume an instantaneous glow to light his weed. Though this application of electricity is of comparatively recent date, the advantages are so distinctly apparent in the lessening of life's little worries that the use of electric appliances in the home is being rapidly extended. The most commendatory feature is that the saving in trouble effected is secured at so little cost.

GALVANISING BY VAPOUR.

Recently a new means of galvanising has been perfected. It is the invention of Mr Sherard Cowper-Coles, M.I.E.E., the well-known electro-metallurgist, whose 'sherardising' process of galvanising is well known. It is quite distinctive from all other methods of galvanising, since the articles to be treated with zinc are not brought into contact with the molten zinc or any of its compounds. Instead it is placed in a separate chamber, where it is submitted to treatment with zinc vapour. The apparatus comprises a small inner drum made of wire-netting of small mesh, in which the objects to be coated are inserted. This cage is slowly revolved within an outer drum made of wrought-iron containing the metallic zinc, and is heated by gas, the electric furnace, or some other means, to a sufficiently high temperature to volatilise the zinc. Hydrogen gas is then forced into the apparatus through a suitable tube. The rotation of the inner cage containing the articles to be treated is essential in order to ensure their receiving an even deposit of the vapour. This 'cowperising' system, as it is called, is especially applicable to the decoration of porcelain and metallic surfaces, the zinc coating being of exquisite brilliancy and delicacy.

PRESERVATION OF CHERRIES IN BRINE.

The problem of satisfactorily and economically packing cherries for transport to the various foreign markets where they are subsequently devoted to a wide variety of purposes, especially for general confectionery, has long been somewhat difficult in the fruit-growing districts of Italy. Some two or three years ago, however, a brine-system was devised which was claimed to be far preferable to the methods then in vogue. The *modus operandi* is to submit the picked fruit for a certain period to sulphur fumes, and then pack them in casks filled with very strong brine. It was found that under these conditions the fruit withstood the rigours of transport exceedingly well, even to the most distant markets, and the sulphur and salt were found to exercise no deleterious effects upon the cherries

for any subsequent manufacturing process. Owing to the success of this method it is now rapidly supplanting those previously practised, the exports last year increasing by more than 100 per cent. in value as compared with the previous twelve months. The bulk of this fruit finds its way to the United States, where the absence of duty enables it to compete very fiercely with the home-grown product. On arriving the cherries are unpacked and sorted into grades. The finest are sold for the flavouring of the many stimulating and appetising drinks for which the States are so famous, the second quality is preserved in brandy, while the other grades are devoted to the numerous classes of confectionery. The success of the process in the preservation of the cherry should render it equally applicable to other fruits, such as the plum, and it might very profitably repay exploitation in this country.

THE IDEAL MUSEUM.

At the recent conference of the Museums Associations some interesting opinions as to the ideal arrangement of a museum collection were expressed in the course of the presidential address of Dr Jonathan Hutchinson, F.R.S. Certainly the views he gave utterance to might very profitably be digested by many of our municipal authorities, who appear to dispose their collections without the slightest sign of rhyme or reason, simply compressing them within the allotted space in accordance with what may be best described as a 'fill-up' policy, utterly oblivious of the fact that such exhibits are primarily intended to impart an objective education. Dr Hutchinson's ideal is that the material displayed should be capable of being handled by the visitor or student in order that observations might be directly made, thereby making book subservient to objective education. Within certain limits such a method might be advantageously practicable; but the fact must always be remembered that a certain section of the public, especially of the visiting class, are animated to some extent by motives of vandalism or souvenir acquisition. At Haslemere and Selby Dr Hutchinson has established museums upon the lines of the principles he advocates, where he has endeavoured to induce the visitor to handle the exhibits. These are, however, essentially 'local-interest' establishments. It does not require much imagination to conceive what would happen in our national museums or similar institutions in our great centres were the public permitted to handle the contents. One, however, will quite coincide with the views of this eminent scientist in regard to the design of such buildings. Elaborate edifices with imposing and costly frontages and elevations might very advantageously be abandoned, and the cost thereof expended in acquiring additional ground-area, so that abundance of space for the arrangement of the collection, with plenty of top-light, might be available. Excellent also is his proposal for the provision of temporary museums in all towns and villages, housing specimens comprising the most common objects obtainable.

A WHITE ANT RESISTANT PAINT.

The task of thwarting the ravages of the white ant in tropical countries is only too well known. It is for this purpose that iron is so extensively used in such climes; since, although more expensive both in first cost and maintenance, it is the only available material capable of resisting the voracious attacks of the termites. The great difficulty is that one cannot conceive that a structure is being destroyed by this insatiable pest until the whole fabric suddenly collapses, for the simple fact that the ants only work upon the interior of the wood, leaving the outer skin, which is about as thick as paper, absolutely untouched, so that to all intents and purposes the woodwork seems perfectly sound. This new composition is a paint, and is applied with a brush. It has been subjected to several trying tests, and certainly appears to justify the claims of its inventor. It has, moreover, anti-fouling and anti-corrosive qualities, being fatal to all molluscs and vegetable organisms, while it also successfully resists the corrosive action of salt-water and atmospheric influences. Should it be equally proof against the onslaughts of the teredo, which in tropical and semi-tropical climes occasions so much anxiety, contractors and harbour engineers will indubitably welcome its introduction.

A NEW DISINFECTANT.

In a recent issue we described a process of manufacturing an electrolytic disinfectant from artificial sea-water that has been successfully practised by a London metropolitan authority. This enterprise is purely municipal, and the product is solely disposed of in the interests of the borough concerned. Recently, however, a private company has undertaken the manufacture of a similar disinfectant upon an extensive scale, under the name of 'thalassol.' As was pointed out in our article, chlorine constitutes one of the most powerful and efficacious germicides at our command, excelling in value the well-known coal-tar derivatives, of which carbolic acid is the best example. This new product is prepared in precisely the same way—namely, the passage of the electric current through a solution of an artificial sea-water composed of solutions of the chlorides of sodium and magnesium; but a new means has been discovered of fixing the liquid and thereby rendering it absolutely stable. Upon its emission from the last trough of the electrolytic plant, a preservative substance, the character of which is a secret, is added in small quantities. This has the effect of fixing the chlorine, so that the disinfectant is a perfectly stable, and will retain its qualities for a prolonged period. It is impossible to add too excessive a quantity of this preservative, since any beyond what is required to produce stability is discarded and deposited in the receiving vessel,

whence it can ultimately be secured and used for treating further quantities of the solution. The liquid as manufactured has a strength of twenty grammes of available chlorine per gallon, and is liberally diluted for use. One great advantage it possesses as compared with carbolic acid and other similar germicides is that it is non-poisonous, rendering it applicable for internal administration with perfect safety.

THE GROUSE-DISEASE INQUIRY.

This inquiry, which is still in progress, has thrown much light on the habits as well as the diseases of grouse. The interim report issued by the Board of Agriculture and Fisheries mentions that our grouse-moors permanently employ three thousand nine hundred men, and have a rateable value of six hundred and fifty thousand pounds. Since 1900 some eight hundred grouse have been examined and the results recorded, and the intimate connection of food-supply or the want of it is shown in the health and vitality of grouse. Parasites have less chance when food and vitality are at their best. That grouse are destroyed by eating frosted heather is denied; they do not eat it. Grouse feed from dawn to dark on heather mainly, and twenty or thirty other plants, including various seeds; heads, stalks, and buds of blaeberry, and berries of crowberry and bog-cranberry. Young grouse eat insects and swallow quartz grit when scarcely forty-eight hours old. Quartz grit is best for the crop of grouse, and moors on a sandstone foundation owe their health-record as much to the quartz grit as to anything else, while draining is also helpful.

NEW METHOD OF CLEANING THE EXTERIOR OF STONE BUILDINGS.

As is well known, exposure to the atmospheric influences prevailing in our large towns and cities, especially where large quantities of sulphurous smoke abound, exercises decided deleterious effects upon stone used for building purposes. In a short time the surface becomes badly discoloured, then pits badly, and afterwards shows evidences of serious decay. Such buildings are from time to time renovated by the application of a sand-and-steam blast which removes all the external decayed particles, restoring the surface to its bright pristine appearance. Such a process is only temporarily effectual, as in a few years the surface is as discoloured and decayed as before. It is obvious that what is required is some means of preserving the new surface after it has been cleaned. In a recent experiment in Glasgow, where the front of a large stone building rapidly decaying was taken in hand, a new method was resorted to which has been attended with conspicuous success. The stonework was first cleaned with a powerful abrasive, in this case carborundum, which completely removed all the decaying and corroded surface. The cleansing medium was in the form of small briquettes convenient to handle, with which the men thoroughly scoured the stone surface under treatment. Upon this being accomplished, the cleaned masonry received a coating of 'lithoderm,' the successful new stone-preserving composition. By penetrating the surface of the stone to a depth of a quarter to one and a quarter inches, according to its texture, the material is considerably hardened and rendered impermeable, thus effectually protecting the inner mass from corrosion, while at the same time it has been found that cleaned stone so treated retains its natural appearance and colour for a considerably longer period. The success of the treatment in this instance has aroused considerable interest, and promises to go a long way towards realising an economical and efficacious method of cleaning stonework.

COLLECTING SNAKE-POISON FOR MEDICAL PURPOSES.

The poison of one of the most venomous snakes is of extreme value from the medical point of view for the treatment of certain phases of insanity and infectious diseases. As, however, it is essential that the venom should be extracted from a living reptile, the operation is decidedly exciting and dangerous. The curative, however, is used in such small quantities that the infinitesimal amount secured from a single serpent is sufficient to last the world for about half a century. Most of that hitherto used in this treatment was obtained as far back as 1828 by Dr Hering, who effected his collection from a snake on the upper waters of the river Amazon. Recently two fresh supplies were obtained, in London and New York respectively, from snakes kept in captivity, and in each case the method of extracting the venom was practically the same. The reptile was first secured by means of forked sticks suddenly placed over its neck and tail, which frustrated all efforts to escape. It was then grasped dexterously and tightly round the head in such a way as to prevent it from striking its captor. In front of its jaws a small glass beaker covered with a piece of fine gauze was placed, and the reptile was urged to strike at the gauze, which it pierced and projected a small quantity of venom into the beaker. Three successive strokes were made, and the quantity of poison thus secured (which is of a yellowish colour) approximated seventeen and three-quarter grains. To this was then added ninety-nine parts of sugar and water to every one part of poison, and the whole pounded in a mortar and reduced to a white powder. As for medical purposes less than one-millionth part of a grain constitutes a dose, it will be seen that the supplies thus extracted will be sufficient to last the world for a considerable time to come.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor.

SIXTH SERIES.

DRIFTWOOD.

By B. M. DANBY.

IN EIGHT CHAPTERS.—CHAPTER I.

OVER Thorpe Somerville dawn was breaking. July was barely half-spent, and the giant trees round and about the old house were still in the full richness of their midsummer beauty. Acres of magnificent park-land stretched away into the far distance, to the shimmering silver thread that marked where the river Arne formed one of the boundaries of the Somerville estate. Not a sound broke the stillness of very early morning; the house and its surroundings slept as sound as the seven sleepers until the great clock at the stables chimed the hour in five slow, resounding strokes.

As at the touch of an enchanter's wand, the sleeping world awoke. At the home farm a boy swung open the yard gate, and putting both hands to his mouth, gave a loud, shrill call, which brought the soft-footed cows from their pasture, lowing as they wandered slowly to the milking-sheds; trappings rattled in the stable; horses neighed; while the poultry streamed, cackling and crowing, from their roosts to the corn a white-aproned girl threw broadcast with liberal hand.

In the grounds gardeners were already at work, raking the broad walks, examining the blooms in the rose-garden, mowing the terraced lawns, whence the scent of the fresh-cut grass floated up to the line of windows along the south front of the house.

This beautiful home belonged, by right of a long and direct line of ancestry, and the favour in the first instance of a generous sovereign, to Sir Hugh Somerville, tenth baronet of his name. The Somervilles, descendants of one Hugo Somerville, knighted when Elizabeth was queen for piratical exploits on the Spanish Main and, it was whispered, for other forms of gallantry on land, held no indifferent record. As soldiers, sailors, or statesmen, each had in turn contributed something to the wealth and honour of his race; the wonder was that the buccaneering ancestry had produced so few rakes. The sole exception, and therefore the more noteworthy, was the only son and heir of the present inheritor of Thorpe Somerville. Hugo Somerville, spoilt child and favourite of fortune, had been, at twenty-one, sent down from Oxford, where he had dissipated his dead mother's fortune and spent all and more than the generous allowance given him by a too indulgent father. He returned home to bring ruin and disgrace upon an honest village-home not far from his own; and finally, after three years of the worst possible behaviour, disappeared, leaving behind him a trail of grief, debt, and disappointed hopes.

Sir Hugh, as soon as he in some measure recovered from the blow Providence had thus dealt him, cast the past behind him, and centred his thoughts on his daughter Muriel, now nearly eighteen years old, and a remarkably striking and beautiful girl. In character she was, perhaps, younger than her years. Her mother died within a few months of her birth, and she had therefore grown up in the care of a trustworthy and good woman, who in matters educational had been willing to conform absolutely to Sir Hugh's theories. The result, strange though it may appear, satisfied both. The one real grief Muriel Somerville had ever known was associated with her brother's escapades and final disappearance; yet even this was more through comprehension of what it meant to her father than any acute pain or loss on her own account. Hugo was her senior by some six years, and at the time when he was making himself notorious at home she was completing her education at Dresden under the kindly chaperonage of good Miss Fancourt. That lady, when in due course she presented Muriel 'finished' to her father, had announced her desire to spend her remaining years in the parish of a clerical brother, thus leaving father and daughter to themselves. The arrangement

 [*All Rights Reserved.*]

answered even better than the clever old woman hoped. Muriel was intensely happy as her father's right-hand and constant companion; while Sir Hugh renewed his youth and forgot his troubles, at any rate for a time, in the daily association with the young girl's exuberant health and spirits. Little occurred to disturb Muriel's happy thoughts, and that little was far away, as she lay asleep in her rose-hung room, a smile upon her parted lips, lulled only to deeper slumber by the click of the mowing-machine beneath her window.

Upon a little knoll some quarter of a mile from the house stood a rustic summer-house, almost wholly screened from observation by the wealth of foliage round it. Over the doorway Muriel had herself trained the crimson rambler, and the vivid red of its countless blossoms threw a brilliant patch of colour on the deep-green background of leaves.

Even at this early hour the summer-house concealed two occupants, whose bearing and appearance clearly indicated that their right to be there was doubtful. The younger, and the more disreputable-looking, of the two might almost have been handsome save for the fact that a drooping, fair moustache failed to hide the tell-tale weakness of his mouth and chin. The face was that of a man who had never possessed sufficient force of character to be either bad or good, a type whom Fate mocks at every turn. His clothes, like those of his companion, were shabby; while the linen of both, though clean, was frayed at the edges. 'Down on their luck' was written all over them, and the knowledge of it appeared to depress the younger man. The elder, however, wore his threadbare clothes with an air impervious to any consciousness of their defects; his carefully trimmed moustache and polished nails showed him by no means lost to the small amenities of life—also that, as yet, he had not banished hope. 'A gentleman—once' was written beyond disguise upon an exterior no one who saw him could help associating with a shady past. What that past contained was as inscrutable as the man himself. Even his age was a problem; he might have been forty, or he might have been a good many years less or more. Dissipation and indulgence had left their subtle signs upon his features, but the deep-set eyes flashed with a fire and vitality no excesses had been able to impair. His hand was as steady as the proverbial rock as he took a pipe from his pocket and, with the utmost deliberation, began to fill it. The younger man watched him uneasily.

'I wouldn't smoke, Cathcart,' he said at length; 'it might be awkward.'

'Why not, my dear chap?' returned the other. 'You're at home, ain't you? and my tobacco's good.'

His companion gave a stealthy glance round him, his face clouding as he spoke. 'Shut up, can't you?' said he. 'You never know who may be listening about these confounded holes and corners.'

His irritability drew no immediate response from the other man, who sat quiet, without looking up or showing himself conscious of anything unusual in the other's tone. 'Well,' he said at last, 'what does it matter? Some day you're bound to come into all this, and then we shall see how soon Sir Hugo Somerville will wash his hands of Dick Cathcart. You never told me,' he went on with a fine appearance of carelessness, 'if the property is entailed.'

'Oh, that's right enough,' the young man replied gloomily, 'and I'll be bound you know it as well as I do. A lot of good the 'tail will do me. My sister will have the money, while I shall be left with this big barracks of a place and nothing to keep it up on.'

'Your sister will be an uncommonly rich woman,' Cathcart observed.

'Muriel will have fifty thou. if she has a penny. The governor's been spending nothing all these years.'

'Since he squared accounts with you,' Cathcart murmured. 'Man—Somerville, Jones, whatever you call yourself—what have you to complain of? With a place like this at your back you could do anything.'

Hugo Somerville rose from his seat, and leaning against the trellis of the little arbour, stood looking down at his companion, an odd expression on his weak, handsome face. 'What's your game, Cathcart? I know you have one, and I know that you know I can't afford to make terms; I simply haven't a sou.'

Cathcart laughed. 'On this'—with a comprehensive wave—'Isaacs would give you almost any sum you cared to name.'

'You know he won't,' the other returned; 'neither he nor any one else will let me have another sixpence. I know it is a d—d plot, and that you're at the bottom of it; but I can't see through it, and you were always too cute for me. The best thing I could do would be to put a bullet through my head and make an end of it all. You could fight as you liked over my worthless carcass.'

Cathcart knew his man, and the threat failed to alarm him. 'Sit down,' he said at length; and something in the tone, more than in the words themselves, made the younger man flush angrily. He obeyed, nevertheless, and Cathcart proceeded with what he had to say. 'Now,' he began, 'you've been pretty open with me, and I'm going to be the same with you. I'll not deny that I'm down here, at Isaacs's request, to have a look at what you're likely to come in for, and make a report to him. If he is satisfied, he is prepared to advance you a certain sum, and to keep on advancing on your note of hand. Under certain conditions'—here Cathcart lowered his voice—'Isaacs offers to give you the chance of redeeming

the cheque bearing your father's signature, which he never signed.'

'You seem to know everything, Cathcart,' the young man muttered angrily under his breath.

'Very nearly,' Cathcart assented easily; 'though that isn't the point. This is: for some reason or other, the Jews are fighting shy of you; the only one who will do anything for you is Isaacs, and what he does depends on what I represent to him about you. What I am compelled to remind you of is that I'm a poor man, and can't afford to do anybody a good turn for nothing. But I don't want to press you too far.'

'Because it will pay you better to bleed me,' the other replied bitterly.

'My good chap, I can't bleed a stone,' objected Cathcart. 'Do be reasonable.'

The young man smiled—a twisted, unpleasant smile. 'Well, what are your terms?' he asked. 'Beggars can't be choosers.'

Cathcart hesitated. 'I want your consent first,' he said at length.

'Without knowing what I'm letting myself in for? You're mad, Cathcart!'

'Not one-quarter so mad as you will be if you refuse.' The tone, again far more than the words, was in itself a threat. Cathcart was a past-master in the art. He had never known its terrifying effect to fail.

'You drive hard bargains, Cathcart,' Hugo Somerville said with a bitterness he did not attempt to hide.

All the same, Cathcart knew that he had won his point. 'Not at all,' he said cheerfully—he could well afford to be cheerful; 'you'll live to bless the day. I must have your name to this bit of a screed, and then we'll be off. It's getting rather too dangerously lively here.'

CHAPTER II.

'I HAVE some news for you, Muriel,' Sir Hugh Somerville told his young daughter one morning, a few weeks later, as the two sat at breakfast in the pretty breakfast-room overlooking the terrace. 'The Lodge is taken at last.'

'Really, dad? By some one nice, I hope. Oh, and I do hope they are fond of games, and that there are young people! Do say there are!'

'My dear, you go too fast for me,' Sir Hugh replied, smiling at Muriel's enthusiastic reception of his news. 'I fear, however, that you are doomed to disappointment as far as the new tenant of The Lodge is concerned. Stevens, Colonel Markham's agent, says he is a man of about forty, name of Cathcart, with neither chick nor child belonging to him. He wants fishing and shooting and a quiet life, I gather. He has taken the house furnished, just as it stands, with no stipulations except a fresh coat of paint for the dog-kennel.'

'Oh daddy!' Muriel said in a tone of such blank disappointment that her father laughed again.

'Does forty seem too dreadfully old?' he demanded. 'I dare say the poor man may be equal to a game of tennis occasionally.'

'Oh yes, I dare say,' Muriel assented; 'but you know, father dear, I did hope we were going to have some young neighbours at The Lodge. Did Mr Stevens say if Colonel Markham was better?'

'No, indeed, poor chap; the gout has him fast enough. Do you feel inclined for a ride over there this morning? Your friend Madge would be glad to see you.'

For some unknown reason, the quick colour mounted to Muriel's cheek; but, with a well-assumed air of indifference, she replied, 'Not to-day, dad, thank you. I have half-a-hundred things to do that positively won't wait any longer. What time shall you be back if I come and meet you with the dogs?'

'Oh, about half-past twelve. Sure you won't change your mind and come with me after all?'

'Sure!' the girl laughed, shaking her head gaily; but there was a cloud on her pretty brow half-an-hour later as she watched her father riding down the avenue alone. Seldom it happened that he was allowed to ride unaccompanied to Western, as the Markhams' place was called.

Colonel Markham and Sir Hugh Somerville were lifelong friends. Neighbours at home, both had gone to the same preparatory school, whence they duly passed on to the same house at Eton. Somerville, however, went on to Oxford; while Markham, who came of a long line of soldiers, entered Sandhurst. After that their ways divided for a term of years. Sir Hugh came early into his inheritance, and settled down to the life of a country gentleman; but it was not until he was verging on middle age, and beginning to be troubled by attacks of gout, that Colonel Markham gave up the service and came to Western for good.

Sir Hugh Somerville spent the first few years after leaving Oxford in foreign travel. On a voyage round the world he met, in Melbourne, the beautiful Australian girl who in a short time became his wife. He brought her home; but after the freedom of colonial life, the sober grandeur of Thorpe Somerville depressed her and cramped her nature, till, at the birth of her second child, she sank quietly out of the life to which she was never able to adapt herself.

Hugo, named after a Cavalier ancestor, inherited his mother's dislike of restraint, without the force

of character which rendered it in her but a fierce hatred of convention. Where she had been strong to suffer and endure, he rebelled, and his want of control led him at every stage of his life into difficulties from which he proved incapable of extricating himself.

Muriel was more fortunate. So far as could be judged from a character as yet apparently unformed, the natural sunniness of her disposition was allied to a fund of steady good sense and sound principles. Development had come through long intercourse with the numerous family of Markhams, most of them older than herself, and now married and gone away to homes of their own. Madge, the youngest and only unmarried daughter, Muriel's greatest friend, was the sole remnant of a large clan, except for the brothers who now and then came back from their various regiments to spend their long leave under the old roof-tree. The Markhams were a good-natured, happy-go-lucky, hot-tempered race, loyal to each other and to their friends, open-handed to a fault. No cloud had ever arisen to disturb the happy harmony between them and the Somerville neighbours until, at the end of Muriel's eighteenth year, Harry Markham came home on leave and set agoing an element which bade fair to change the current of affairs. The young soldier, after an absence of five years, found the little girl in short frocks whom he had teased and played with grown into a stately young lady, and had promptly fallen in love with her.

Into Muriel's mind no thought of love had as yet entered. She was still a child at heart, though the short skirts had been replaced by long ones, and the strange, new thrill was an uncomfortable mystery to her. It frightened her, and took away her content in the little, ordinary things of life that, until then, had been happiness enough. She kept her own counsel, and even to Madge said nothing of what she felt. What, indeed, was there to say?

Harry, less unsophisticated, took little Madge into his confidence, and in a hundred ways found he had built even better than he knew. But now Madge was away on a long visit to a distant relation, and Harry was obliged to rely on his own diplomacy for his opportunities. It must be confessed that the young soldier soon developed a remarkable talent for discovering these, aided sometimes, perhaps, by Sir Hugh himself, who liked the young man's downrightness and obvious sincerity. So that no great gift of foresight was required, when, on the conclusion of his visit to Western, Sir Hugh brought Harry back with him to Thorpe Somerville to luncheon, to suggest to Muriel the probability of this result.

With a pleasant sense of expectation, mixed with a little excitement, she let loose her dogs and set out gaily on the road to Western to meet her father. The road was a quiet one; but Muriel was not a nervous girl, and it was with no feeling of alarm that she noticed a man lying under the hedge by the roadside, to all appearances asleep. The dogs growled suspiciously at the sight, or scent, of the stranger; but throwing no more than a careless glance at the recumbent figure, Muriel whistled them to heel and passed on her way.

No sooner was her back turned towards him than the man sprang up and followed her, walking noiselessly on the grass siding, and taking care to keep a distance of ten yards or more between them. At last, having apparently made up his mind as to what he intended to do, he rapidly overtook her, and approached so closely that the hindmost terriers turned on him, barking and showing their teeth. When Muriel turned round to see what was exciting them, the face that met her own, weak and dissolute though it was, filled her with a vague alarm. She was a plucky girl, and although her first instinct was to take ignominiously to her heels, she stood her ground and faced her shabby pursuer with the best appearance of courage that she could command.

'Can you tell me the time, please, miss?' he asked, civilly enough, in a voice which was refined in tone in spite of the roughness he was evidently trying to put into it.

'I am sorry I cannot,' Muriel replied, preparing to pass him on her way back to the lodge gates. She had changed her mind about going farther that day.

'Has your ticker stopped?' the tramp inquired with a grin, pointing as he spoke to the little, enamelled watch that she wore pinned to her breast. So obviously caught, Muriel coloured furiously.

'I forgot that I was wearing my watch,' she explained with dignity, although her heart was beating fast, more with alarm at the strangeness of his manner than at anything he had said. 'It is just one o'clock;' and returning the little, jewelled toy to its place again, she made as if to pursue her homeward way. The tramp, however, still stood in front of her, and evinced not the slightest disposition to move.

'That's a pretty thing,' he observed, indicating the watch with a nod; 'it must have cost a lot of money. I suppose, now, you wouldn't like to hand it over to me?'

'I should not,' replied Muriel, mustering all her courage; 'my father gave it to me, and I value it very much. This is all the money I have,' she continued, taking a small purse from her pocket and offering it to the man; 'you are welcome to it, if you will let me keep my watch.'

'Much obliged,' he returned, coolly pocketing the purse; 'but I'll trouble you to hand over the watch too. Without a fuss, now!' he added, more threateningly than he had as yet spoken.

At the aggressive insolence of his manner Muriel's

fear vanished, and her anger rose instead. 'I shall do no such thing!' she declared with spirit; 'and if you do not instantly allow me to pass, I shall set my dogs upon you!'

These worthies apparently were ready enough, and were already growling and snarling at the stranger's heels—all save Rory, the old collie, who crouched down before him, whining piteously. All demonstrations the tramp treated with equal indifference as he watched Muriel curiously through his half-shut eyes.

'It's a pity you can't give some of your pluck away,' he remarked; 'another member of your family could have done with a little.' Then, seeming to notice the growling crowd of dogs for the first time, he said, 'Old Rory's living yet, I see. He must be a very old dog.—Here, old man!'

And, to Muriel's unbounded astonishment and dismay, the old collie crawled up to the tramp and licked his hand.

'Why, Rory knows you!' she cried.

'Of course he does! It's only humans who have short memories. Don't *you* know me?'

Muriel looked at him with troubled eyes. 'No, I don't,' she said; 'though you remind me of some one, I can't think whom.'

He gave a short laugh, not pleasant to hear. 'Perhaps it's as well,' he said roughly. Then, as if remembering the part he had set out to play, 'And now, for the sake of that reminder, will you be kind enough to make me a present of that pretty little watch? Even then you won't have any idea what it feels like to be hard up. No, you don't!' and he started forward and seized the girl by the wrist. He was just a second too late; for Muriel, with a quick movement, put the handle of the whip she carried to her lips, and a loud, shrill whistle rang through the still air. With a muttered imprecation her assailant released her, and vaulting lightly over a gate, was soon across the field and in the safe shelter of the wood beyond.

Trembling with terror and relief, Muriel did not at first see to what opportune arrival she owed her freedom, when a voice near at hand recalled her to herself.

'I fear that ruffian has alarmed you very much. I wish I'd had the luck to be a minute sooner.'

Muriel looked up with a quavering smile. 'He frightened me dreadfully, he was so strange—not a bit like an ordinary tramp, although he said he wanted my watch.'

'I hope you gave him nothing. I'm afraid it would be no use following him; he's got too long a start.'

'Please don't think of doing that. I gave him my purse; but there were only a few shillings in it, and he is welcome to the money if only I never see him again!'

'The scoundrel!'

Muriel was quickly recovering from her fright. A glance at her rescuer showed him to be a good-looking, well-set-up man of apparently about forty years of age, the sprinkling of gray in the thick, dark hair above his temples, and the few lines about his mouth and eyes, alone betraying the passage of time. He was carrying a fishing rod and basket, and the still active and youthful-looking lines of his figure were accentuated by his well-made and perfectly fitting clothes. A critic might have objected to them on the score of newness; Muriel, however, found no fault.

'Perhaps I had better introduce myself,' the stranger said. 'I am the new tenant of The Lodge.'

'Then you are Mr Cathcart!' Muriel cried joyfully. 'My father told me you had taken The Lodge. I am Muriel Somerville,' she added, blushing as Cathcart bowed with a courteous deference that in itself was a flattery.

'Here he comes!' she cried as the noise of horses' hoofs was heard on the clear air, and soon two riders came in sight round the curve in the road. 'Oh, Harry Markham is with him!' she added. The change in her tone did not escape Cathcart's quick ears. He turned round as the horsemen approached, and followed Muriel slowly as she ran to her father and poured out the story of the morning's adventure.

Sir Hugh listened with evident concern. 'And this is the gentleman who so opportunely came to your rescue?' he said, turning to Cathcart.—'My dear sir, I cannot thank you enough.'

'A fortunate chance made me come up in the nick of time,' Cathcart said modestly, 'though I'm afraid I was not soon enough to prevent Miss Somerville being badly frightened.'

'Ah, well, I have often told her I do not consider it safe for her to wander alone beyond the gates; but wilful young people must take their own way,' Sir Hugh said, smiling at his daughter without any show of serious displeasure.

'I'm sure you are right, sir,' Harry Markham struck in, avoiding the disdainful glance Miss Muriel flashed at him.

Nothing escaped Cathcart's watchful eyes. A vestige of a smile flickered round his mouth as he tactfully turned the conversation into another channel. 'I was hoping to meet you, Sir Hugh,' said he. 'I was anxious to ask about the shooting and fishing rights of the water the people about here call the Fairy Pool. It seems to be a sort of No Man's Land—or water; but I understand, from the terms of my agreement, that the sporting rights lie between yourself, as lord of the manor, and me, as tenant of The Lodge.'

'That is so, Mr Cathcart. You and I must talk the matter over with Captain Markham, as his father's deputy.—Harry, my boy'—turning to the young man—'let me make you known to your new tenant.'

The two men looked each other in the eyes, each unwilling, yet expecting, to recognise a rival. Sir

Hugh, for his part, saw nothing of the contempt Cathcart took care to instil into his manner to the young man, nor the latter's obvious distrust and dislike of his new acquaintance.

'Well, come along, both of you, and have some luncheon,' the baronet said genially; 'that is, if you will excuse an informal invitation, Mr Cathcart.'

'I shall be most happy,' Cathcart replied, ranging himself at Muriel's side, secure in the smile of welcome which made Markham, under his breath, curse the unkind fate that had brought this meddling elderly coxcomb within a hundred miles of Thorpe Somerville.

(To be continued.)

STRANGE GIFTS TO ROYALTY.

WERE a royal personage to accept all the offerings made by subjects and admirers, known and unknown, standing-room in royal residences would soon be at a discount. All royalties, but reigning monarchs especially, are constantly bombarded with gifts of every kind and with letters offering presents. Some years ago, when the King, then Prince of Wales, was spending his usual summer holiday at Marienbad, a census was kept of the contents of his post-bag. Within twenty days he received thirteen hundred begging-letters, three hundred and twenty requests for his autograph, two hundred and sixty requests for a lock of his hair or other similar memento, and three hundred presents of various kinds. The latter were a most miscellaneous assortment, and included all kinds of jewellery, from silver studs to gold watches, many different kinds of cigars and cigarettes, also gloves, ties, walking-sticks, scented soap, and sweets. It need hardly be said that gifts of this kind are never accepted by those to whom they are sent. Where possible they are returned; when the donors are anonymous the presents are devoted to charity.

The senders of these presents are no doubt inspired by many different motives. Some desire to popularise a new tie or trinket, and merely to be able to say that His Majesty has accepted such an article is sufficient to start a boom; with others the desire is to say, 'The King possesses something which I sent him;' others again—simple souls—are actuated by feelings of pure loyalty or devotion. In the latter category may be classed the Dutch schoolgirl of Deventer who, on her twelfth birthday, sent to Queen Wilhelmina a large cake which she had herself made and baked and ornamented in letters of chocolate with the Queen's name, which was also her own. The young Queen accepted the gift in the spirit in which it was made. She wrote to the child an autograph letter, and sent also her photograph, on which was this inscription: 'From Wilhelmina to Wilhelmina, on her twelfth birthday.'

There lives no monarch more beloved by his own subjects than is the venerable Franz Josef, Kaiser of Austria. Incidentally, it is worth mentioning that Franz Josef, as lineal descendant of a Roman empress, has a better right to the title 'The Kaiser' than is possessed by his enterprising neighbour the head of the Hohenzollerns. The Emperor of Austria receives all kinds of small gifts from farmers and peasants, such as cakes, preserves, fruit, and flowers. What is perhaps the most curious offering which was ever made to him was the work of a Hungarian blacksmith named Szigoric. In some mysterious manner the man had succeeded in nailing to a goose's egg without breaking it a horse-shoe, a pair of pincers, a file, and a knife. The Emperor accepted this weird curiosity, and sent in return his photograph and a sum of money.

The German Emperor, although perhaps not so widely beloved as His Majesty of Austria, has his genuine admirers. One of them visited the palace at Berlin on a chilly autumn day three years ago, and left with the sentry an envelope addressed to the Emperor. It was found to contain a bank-note for a hundred marks. An anonymous note begged the Emperor to purchase with the money some suits of warm underclothing; 'for,' wrote the donor, 'I saw your Majesty at the review yesterday, and it seemed to me that you were not as warmly clad as you should be.'

Presents arrive at the British Court from all parts of the world. A registered package from Vermont was found to enclose a gigantic prize potato weighing nearly five pounds. It was sent by a farmer named Howlett, and addressed 'To His Majesty the King of England, House of Parliament, England.' Another present from the far side of the Atlantic was a nugget of pure gold found in the Klondike, and valued at two hundred and sixty pounds. It was subscribed for and sent by the inhabitants of Dawson City.

Another strange present lies upon the writing-table of the King at Sandringham. It is the mummified hand of an Egyptian princess who died some three thousand years ago. It was given to His Majesty by a celebrated Egyptologist, and is used as a paper-weight. Speaking of paper-weights, the German Emperor possesses one which is absolutely unique. It is a lump of volcanic rock which was broken from the extreme summit of Mount Kilima-Njaro by Dr Buchner, and by him presented to his sovereign. This morsel of stone was the highest point of German-African territory.

Whenever a royal personage is ill cures and prescriptions of every kind come in by the hundred. The hop-pillow sent to King Edward, then Prince

of Wales, when, many years ago, he lay very near to death from typhoid fever, is an instance in point. More recently, when the Czar was down with the same disease, a bottle of Jordan water was brought to the palace by a subject who had made a special pilgrimage to Palestine in order to procure it. And an old lady who lived near Odessa is said to have actually tramped all the long, dreary way to St Petersburg with a bottle of some specific which she was convinced would cure the 'Little Father' of his malady. When the Prince and Princess of Wales started on their tour round the world many antidotes against sea-sickness came to hand. One enterprising chemist sent an enormous package containing hundreds of special anti-seasick powders, one of which was to be taken every day while at sea. The Prince was much amused. To Sir Francis Laking he remarked, 'I say, Sir Francis, if this fellow expects me to take all these special powders he ought to have sent me a special stomach as well.'

Not all gifts are returned. Where special permission is asked and obtained beforehand a present is accepted in the same spirit in which it is offered, and our own monarch possesses a perfect museum of curiosities which have come to him in this manner. Some of these he prizes very highly. For instance, when the King was in Galway four years ago he was presented with a genuine old Cladagh ring. Cladagh rings, which are now very rare and greatly prized by antiquaries, were originally the wedding-rings of the Cladagh women, and were handed down from generation to generation through the centuries. They are of massive gold, the design usually being a heart and clasped hands, surmounted by a crown, thus symbolising 'Love, Friendship, and Loyalty.'

Again, last winter, when His Majesty opened the African Products Exhibition, an offering was made to him which greatly pleased him. It is a walking-stick composed of a single horn of the now practically extinct white rhinoceros. This stick has a history. More than forty years ago it was given to the famous Louis Solomon by a great Kaffir chief, as a present 'from one great chief to another.' Louis Solomon has been dead many years, and the stick has now passed to a still greater chief. The King delights in walking-sticks, of which he has an enormous collection, said to number in all nearly two thousand.

Corporations and city companies are sometimes privileged to make special offerings to the King. Some years ago the Horners' Company received a letter from Sir Francis Knollys conveying the King's thanks and admiration of a singular and very beautiful gift. This was a casket made of selected specimens of the finest British bullock-horns, mounted with massive silver and gilt straps and ornaments chased in the finest style of early English art.

At the coronation of George I. a magnificent suit of ancient armour was claimed from the Royal Armoury as his perquisite by the Champion Dymoke. Forty years ago this suit was sold by the Dymoke family for about fourteen hundred pounds, and after passing through several hands was purchased on behalf of Lord Lonsdale, Lord Howe, and other noblemen and gentlemen for presentation to the King. The armour is a cap-à-pie suit richly decorated. It was originally made for Sir Christopher Hatton, and bears the date 1585. It now stands in Windsor Castle.

The most valuable gifts which the King has received since his coronation were those sent in 1905 by the Mikado. It will be remembered that Prince Arthur of Connaught was sent by His Majesty to Japan to confer upon the ruler of our allies the Order of the Garter. When the mission returned there arrived with them no fewer than two hundred and fifty packages and boxes of various sizes, which, strongly guarded, were sent at once from Liverpool to London. These contained a unique collection of Japanese works of art and antiquities, such as armour, jewelled swords, Satsuma vases, and the like. From their historical associations these articles are practically priceless. An expert asserts that if thrown upon the market they would realise at least a quarter of a million.

The largest legacy ever bequeathed to a reigning sovereign was the five hundred thousand pounds which the miser John Neale left to Queen Victoria. But it is no uncommon occurrence for subjects to make bequests by will to their sovereign. An eccentric old Scotch lady, by name M'William, who lived near Balmoral, and upon whom our late Queen had bestowed many favours, left to her benefactress a handsomely fitted vault in a neighbouring churchyard. The late Lord Alington left legacies of one hundred pounds apiece to the Queen and to the Duchess of Connaught, and requested that the King would accept a set of very quaint and beautiful waistcoat-buttons.

As for the German Emperor, he has been very fortunate in the value and variety of property left to him by loyal Germans. Six years ago Herr Wilhelm Hildebrand of Goerlitz presented his monarch with a handsome villa at Arco in the Tyrol, which the Emperor converted into a convalescent home for army officers. In the following year Herr Hildebrand died, and by his will left his whole fortune to the Emperor. The total amount is believed largely to exceed two hundred thousand pounds, for besides one hundred and fifty thousand pounds in stocks and shares, there was a large quantity of valuable building-land. William II. also draws a handsome income from a line of steamships which were left to his grandfather by the founder and owner of the line.

What is perhaps the most peculiar of the many bequests to His German Majesty was made by an Englishman. The will of that picturesque personality the late Mr Harry Panmure Gordon contained the following clause: 'I direct my executors

to offer for acceptance to His Majesty the present Emperor of Germany the boat-carriage launched by His Majesty the late Emperor Frederick, and my shooting-carriage on wheels.' Mr Panmure Gordon had a large collection of carriages, and this boat-carriage was, we believe, built from a design of his own.

Animals of one kind or another are very frequently bequeathed to royalty. By the will of a menagerie proprietor three very fine elephants came into the possession of the German Emperor; but as the latter had no personal use for such mountainous steeds, he sent the lot to the Berlin Zoological Gardens. Some years ago the Czar received an equally embarrassing legacy in the shape of a gigantic polar bear. No doubt he would gladly have done the same with the animal as the German monarch did with his elephants; but the Czarina took such a fancy to the splendid beast, with its shaggy white coat, that His Majesty was obliged to order a cage to be fitted up on the premises, and we believe the great creature still resides in state in an outbuilding of the Winter Palace.

President Loubet became very much attached to the little Russian Princesses during his famous State visit to the Russian Court, and all the children have reason to remember 'Uncle Loubet,' as they called him, by the beautiful presents which he gave them. The Grand Duchess Tatyana received a most wonderful toilette service in Louis XV. style. Over the dressing-table is a crown of solid gold, above which is a sort of fan of feathers from the rare Australian lyre-bird. There are over a hundred of these feathers, and as each bird supplies two only, the great value of the present may be easily imagined. The second sister, Anastasia, was delighted with a doll's house of a sumptuousness quite unprecedented; while the youngest, Maria, who was then a mere baby, had an automatic female clown, with, perched on its shoulder, a monkey which imitated with absolute perfection all the clown's movements.

Speaking of presents to royal children, we find that Prince Edward of Wales was given one in Coronation year which exceedingly rejoiced his small heart. It was a perfect miniature model of one of the famous *Powerful* 7·5 guns which helped to save Ladysmith from the Boers. The gift was made at the Botanic Gardens, where the gun, manned by eight little boys of ages varying between six and eight, was drawn up the centre avenue in great style. Another Coronation gift made to the boy who will in all probability one day become King Edward VIII. was a golden replica of the Coronation cup which was presented to the King's poor guests. It bears the inscription: 'Presented to Prince Edward by the children of Paddington, July 1902.'

Perhaps the most charming gift which a small royalty ever received is the beautiful little Sunbeam Island presented only last year to the young Crown Prince Olaf of Norway. The island is very small, but has an excellent natural harbour, and is celebrated for its fine fishing and shooting. It lies in Godo Sound, on the west coast of Norway, near Hardangerfjord, and was formerly the property of an English lady, Miss Musgrave. It was she who presented it to the youngest but one of European Crown Princes.

When the first child of the King of Italy, the little Princess Yolande, was born, the King strictly forbade the offering of gifts to the baby. But certain citizens of Rome pleaded to be allowed to present a golden cradle to the tiny Princess, and the offering seemed so appropriate that His Majesty made an exception in their favour. The cradle accordingly was ordered, made, and presented in state. But some time later the goldsmith who made it wrote to the newspapers complaining that he had only received a portion of the price agreed upon, and that he saw no prospect of his bill being settled. It is said that the King himself was eventually obliged to foot the greater part of the account for Rome's 'spontaneous and enthusiastic' gift to his little girl.

There may be seen at Windsor two objects intrinsically of trifling worth, yet which were far more highly valued by our late Queen than most of the priceless jewels and works of art which she received in the course of her long reign. One is an old and much-worn Bible. It is the same which General Gordon carried with him all through that marvellous campaign in China, when, with a small force of native troops, he crushed the hordes of Tâiping rebels. This was given to the Queen by Gordon's sister, and has been enshrined in a beautiful casket of crystal and enamel. The second is an appropriate companion to the first. It is the copy of the Koran formerly possessed by Gordon's enemy and slayer, the Mahdi. Lord Kitchener presented it to his sovereign.

The present which is most coveted by all the Roman Catholic royal ladies of Europe is the papal Golden Rose. The Golden Rose of Virtue was last given in 1893 to Queen Henriette of Belgium, and it is stated that its next recipient will be the young Queen of Spain. The jewel, the first of which was presented by Pope Urban VI. to Joanna of Sicily, is a mimic plant of pure gold standing in a golden pot. The leaves are set with diamonds in imitation of dewdrops, and a palm-leaf blessed by the Pope accompanies the gift.

THE KEY OF DEATH.

AMONG the many relics of antiquity preserved in the Arsenal at Venice there is one to which a peculiar and gruesome interest is attached. It is a heavy key, which to all outward appearances might have been fashioned for one of the ponderous locks of olden times. Yet, if tradition is to be believed, it was designed for a deadly purpose, and people were slain by it in a swift, subtle, and mysterious manner. It is known, in fact, as the Key of Death.

The chronicles of the city tell that in the earlier part of the seventeenth century a certain stranger arrived at Venice, a man of dark and sinister aspect. His name was Tebaldo. He appears to have been a man of unruly passions, of great intellectual power, but one whose talents found their chief outlet in crime.

In Venice he established himself as a merchant or trader. For a time his passions lay dormant. They were aroused, however, in a stormy manner, which caused him to sweep from his path all who sought to oppose him.

One day he observed a beautiful girl leaving church, attended in a manner which showed she belonged to a family of high degree. She was, in fact, the daughter of an ancient and noble house, one which had long held foremost rank in Venice. He fell violently in love with her. Though far removed from him in station, his blind passion took no count of this fact, and he determined to sue for her hand.

There proved to be, however, a more insuperable obstacle to his suit. The girl was already betrothed to another, a young nobleman of almost equal rank and fortune. The knowledge did not deter Tebaldo, who boldly presented himself before the girl's parents in the capacity of a suitor for her hand. As might have been expected, he met with a curt and unceremonious rebuff.

The repulse rankled in his mind. Enraged beyond measure, he shut himself up in his own house, and there secretly studied a means of revenge. Profoundly skilled in the mechanical arts, he allowed himself no rest until he had invented a most formidable and death-dealing weapon. This was a large key, the handle of which was so constructed that it could be turned at will. When it was thus turned a secret spring was disclosed, which, on being pressed, launched from the key-head a fine needle or lancet. The latter was of such delicate construction that it penetrated the body of the victim and buried itself deep in the flesh without leaving any external trace.

The marriage of the betrothed couple was fixed to take place in the principal church at Venice on a certain day. Before the ceremony Tebaldo, cunningly disguised, stationed himself at the church door, armed with his diabolical weapon. As the bridegroom was about to enter the building, the concealed watcher pressed the spring and sent the deadly steel lancet into the breast of his victim. The young nobleman had no suspicion of injury at the moment. In the midst of the ceremony, however, he was seized with a sharp spasm of pain, and sank fainting on the steps of the altar. His illness appeared so alarming that he was hurriedly conveyed to his home, where the leading Venice physicians were summoned to attend him. In spite of their unremitting efforts he sank and died, nor were they able to discover the nature of the mysterious and fatal seizure.

With the removal of his rival Tebaldo once more appeared openly on the scene. Again he presented himself before the girl's parents and renewed his request for her hand. Their refusal to listen to him sealed their doom. In what manner he accomplished it is not known, but within a few days both had been done to death in the same sudden and mysterious fashion.

The exalted rank of the victims created a profound sensation; and when, on examination of the bodies, a fine steel instrument was found in the flesh, terror became universal. The citizens feared for their lives. An assassin was at large amongst them, and no one knew upon whom the next blow might fall. The utmost vigilance was exercised on the part of the authorities, but as yet no suspicion fell upon Tebaldo.

The bereaved girl was prostrated by the triple tragedy. Robbed of those who were most dear to her, she retired to a convent, where she passed the first months of mourning in sorrowful seclusion. Tebaldo, however, did not abandon the pursuit. Still hoping to bend her to his will, he sought her out in her retreat, and begged to speak to her through the grating.

His dark, evil face had always been displeasing to her, but since the death of her betrothed and parents it had become repulsive. When, therefore, in the course of the interview, he pressed her to fly with him, he met with an instant and indignant refusal. Her scorn stung him to the quick. Beside himself with rage, he brought his deadly weapon once more into play and succeeded in wounding the girl through the grating, the obscurity of the place preventing his action from being observed.

On her return to her room the girl felt a sharp pain in her breast. Examination of the spot showed that it was dotted with a single drop of blood. Physicians were hastily summoned. Taught by past experience, they wasted no time in vain conjecture, but cut into the flesh and extracted the slender steel, thus saving the girl's life.

The dastardly attempt occasioned a public outcry,

and the State Inquisition used every means to discover the assassin. The visit of Tebaldo to the convent became known and caused suspicion to turn upon him. The emissaries of the law descended suddenly upon him, his house was searched, and there the abominable invention was discovered. Swift justice followed, and he ended his days upon the scaffold.

The key, as already stated, is still preserved in the Arsenal at Venice.

IS THE EARTH OLD OR YOUNG?

By ALEXANDER W. ROBERTS, D.Sc., Lovedale, South Africa.

IN TWO PARTS.—PART I.

WITH what span are we to measure the life of a world? How may we reckon the passing of its apparently endless years? What pulse of time beats out the heart-throbs of a star?

Through the long period of human story our own earth has remained practically unchanged in position and unaltered in structure. History records no rise and fall, no change and decay, of nature's great manifestations. As far back as written statement or oral tradition can carry us, the same sun, undimmed in splendour, shone in the same cloud-bedecked sky; in the night-watches the same sentinel stars kept their ceaseless, unwearied vigil over the same enshadowed, sleeping earth; the same sweet flowers grew by lake and river and stream just as they do to-day. There seems to have been no day in history when cedars were not in Lebanon, pine-forests in northern Europe, and palms in the African desert. Monuments six thousand years old depict the lion and the tiger, the dog and the deer, as faithfully as if they were drawn to-day. The Nile and the Euphrates have run unchanged as to direction and unlessened as to volume for at least a hundred centuries. The great mountains are of old, and even the smaller hills man deems everlasting, while the inviolate sea he regards as an emblem of eternity.

How, then, is it possible to trace the earth's slow, lagging growth from the very beginning of days until our own time; and what vision can discern its long, lingering passage through interminable stages of decay down to its ultimate day of doom as a habitable world? All that appears certain seems to speak of abidingness; that which men regard as reliable records tells the tale of an almost unvarying permanence. Indeed, so apparently unchanging are the moods of our great globe that not a few, and these not confined to any age or race or school, have averred that to things as they are there has been no beginning and will be no end, that circumstance has followed circumstance, an endless sequence of cause and effect, not during untold ages, but during all time. One in ancient days, wiser than any of his fellows—who 'spake of trees from the cedar-tree that is in Lebanon, even unto the hyssop that springeth out of the wall; he spake also of beasts, and of fowl, and of creeping things, and of fishes'—thus sets forth the theory of the cyclical order of nature: 'The thing that hath been, it is that which shall be; and that which is done is that which shall be done: and there is no new thing under the sun.' In later times one of the great pioneers of modern geology, Hutton, insisted that the earth shows no trace of a beginning or sign of an end.

Such a condition of things, however, is to some minds unthinkable, and to most at variance with our whole experience of the mutability and perishableness of created matter. We know intuitively that the present noontide of our beautiful earth had a morning, a dawn, and a drear hour before that dawn. We know, also, that this same earth of ours will have an evening-time, a long-drawn-out twilight of ever-deepening shadows; then the night. The whole teachings of science, the unfolding of geological truth, the testimony of astronomy, the indications of biological research, the unyielding demands of dynamical laws, suggest the impossibility of things remaining unchanged throughout the ages. They all, with more or less directness, give evidence of a natural development, an ordered evolution, a progressive advance from some primeval homogeneous condition of things up to the present complex arrangement of phenomena. They likewise, with no doubt a somewhat uncertain agreement, conspire in predicting a day—dimly distant, it is true—when the very laws which should have made for stately permanence will work disaster and doom to this varied, many-sided earth of ours.

Accepting, therefore, this more reasonable view of the history and fate of our planet, we find the pertinent questions at once arising: Of what day in some remotely distant age can we say, 'On this morning in time was our earth born'? When and how will this same good green earth roll through the night of space a cold, dead, tideless, sunless world? Between the opening gates of day and the final crack of doom, how many æons will come and go in almost endless procession, and in that vast flux of time and circumstance where has the present group of events its place? Are we near the beginning of the long, long march through the corridors of time, or are we well on towards the end

of our journey? Is the earth old or young; in the prime of its youth, the full plenitude of its manhood, or in the evening-time of feeble and decrepit old age?

These are imperial questions, and it is fortunate that in these later days there is an imperial domain of science in which such questions have no alien place. Geological research, astronomical discovery, and biological study have all pushed their boundaries out and out and out till at length they march in a common region of inquiry, an imperial zone, where the deepest and highest questions of our human philosophy find a home.

It is in this imperial region of knowledge that we must look for an answer to the question which stands at the head of this article.

Now, the question, Is the earth old or young? is inseparably bound up with the problem of the age of the earth, just as the answer to the question, Is a man at forty old or young? will depend upon the number of years which we consider to be the span of active human life. We cannot deal with the inquiry which we have set before us more suitably, therefore, than by considering what answer the great cosmical sciences—biology, geology, astronomy—have to give to the problem of the earth's age.

What has biology—giving to this name a far wider meaning than is usually attached to it—to say to us regarding the past history of our globe? Through untold ages organic life has existed on our planet. Does this procession of life indicate a beginning somewhere away back in the dawning morning of creation?

No doubt the tale biology has to tell regarding the past is vague, dateless, uncertain; yet one truth stands out clear and unchallenged. The farther we travel back along the ages the more does the evidence gather that we are groping our way towards a beginning of some kind. Starting from the highly organised creatures of the present day, we may trace the ever-decreasing outlay of vital force through types less and less finely developed, till at length we reach the simple, rudimentary, and embryonic forms of Palæozoic times. The cardinal truth is ever before us, as we view the way along which creation has marched, that the more distant the age the simpler the life-forms.

But is there no evidence of a cyclical return? May not life have ever moved forwards in a sinuous progression, now declining to the lowest point consonant with existence, and then rising again to forms pulsating with vital energy in its most exalted conditions? Not a vestige of proof can be found in support of such a theory. The testimony of the rocks yields but one story: that life has moved onwards and upwards from the simple throb of a piece of jelly or the mechanical movement of a single tendril to the rich and varied flora and fauna which make this royally endowed earth of ours so beautiful and interesting.

The stately and orderly procession of life upon the globe which biology and geology reveal to us is indeed a tale of no common interest. In the rocky folds of earth the story lies hidden; but to the faithfully diligent and honestly curious the book is opened, and the volume may be read even to its earliest pages. And this is, in brief outline, the story of the rocks.

There was a time in the world's history when through its widest reaches a vast silence reigned, a silence unbroken by the song of bird or cry of animal or voice of man. Over its gloomy wastes of land great tidal waves swept and crept. From many a crack and crevice clouds of steam rose to the already mist-laden sky. Now and again over the solitary and dismal shores there reverberated the thunders of some gigantic upheaval, as the contracting shell forced the rigid rocks up into mountainous masses. Life is not yet. All is gray, drear, awful; a pall of desolation hangs over sea and shore. Dripping skies, tide-tossed seas, heaving rocks, a world in travail! Then life, from whence God only knows, for regarding this epoch-forming, world-begetting event science and philosophy are equally silent. But life it is, a moving, wobbling piece of jelly, the protoplasm, the raw material, out of which a living garment of flowers and fruit, of trees and shrubs, of fish and fowl and four-footed things, may one day grow. And how surpassingly beautiful and supremely wonderful the weaving of that glorious garment of luxuriant beauty that now clothes the earth in pleasing grace has been! First there is the uncouth jelly. Then after the lapse of ages a protective shell forms a home for the living organism. Thus early in its long, long journey towards a higher and yet higher perfection of type does life exhibit one of its fundamental characteristics—self-protection. Another fundamental characteristic is progress.

By the shores of ocean, now less storm-tossed by tide and current than in earlier days, seaweed has begun to grow, and in the quieter valleys mosses and lichens cover the rocks. Very early in the onward march of things fish make their appearance in the shallow seas—fish with armoured scales—and in sheltered pools great crabs disport themselves. The mosses and lichens also give place to tree-like plants, giant ferns, and mammoth grasses. In the moist, warm undergrowth of these embryo trees insects two feet long creep and crawl. In this opening period of the earth's history as a life-bearing planet, a period which geologists have called Palæozoic, which means dawn of life, the organism of plants and animals is exceedingly low. But consider their size, one may urge. Yes, there were giants in those early days; but size and sense do not always go together; and thus it is that the little mouse that to-day nibbles the crumbs in an Oxford kitchen is vastly higher in the scale of life than the Pleiosaurus who waddled clumsily

through the shallow lake that existed ages ago where now the great university rises many-towered and stately.

Succeeding this earlier age, the Palæozoic, we have a Secondary epoch when great reptiles and gigantic lizards swarmed over the shallow lagoons or crashed through the thick tropical forests that then covered the greater part of our globe. It was an age teeming with a huge and primitive life. Creatures half-bird, half-reptile made the forest trees their home; huge monsters forced their way through the tall rank grass; fierce lizards, the sea-serpents of this earlier age, filled the seas with terror. Sea-shells three feet in diameter lay along the shores like upturned rocks. Life was everywhere, abundant, vast, majestic, yet withal simple, dull, and stupid.

As the Secondary epoch grows towards a close we meet with forms of life more akin to those of our own day. The half-bird, half-reptile creature has given place to a less hybrid form; for when the Tertiary chapter of geological and biological story opens true birds are to be found in great abundance.

In the Tertiary epoch mammals arrive on the stage of time. The great lizards, the giant reptiles, with their huge frames and small brains, are practically a thing of the past. Life has swept one stage higher in the ever-ascending scale. No doubt many of the old types, shells and weeds, insects and grasses, have remained from age to age practically unchanged; but their very survival accentuates the gulf that separates them from the higher forms of plants and animals.

With the close of the Tertiary period of life we forthwith enter upon the last stage of our earth's earlier history. As if to prepare one portion of the globe for its future tenantry, there sweeps down over sea and shore, upon hill and valley, a great deluge of ice. How impressive must have been the irresistible march of that oncoming northern flood! Through untold ages it slowly moved downwards and outwards across the hitherto fertile lands and tropical regions of central and western Europe. Over America and Asia also the great desolation passes, a vast field of ice fully three thousand feet thick. It scooped out whole valleys in its remorseless gouging career; it carved the hills to a rougher, grander beauty; it piled along the cliffs of northern Scotland a fringe of great boulders, miniature castles to delight the hearts of little children in the coming ages; it overwhelmed many a fruitful valley and fertile plain under a sheet of glacier clay. What a scene must have been presented in northern lands, when even as far south as the equator,

> Ice, mast-high, came floating by
> As green as emerald;

and over what is now the British Isles there stretched a tumbling, crumpled continent of ice, a vast white desert, above which only the higher heights appeared as snow-clad islands!

Then the ice age slowly passed away. At length, after thousands of years had come and gone, the glacier-fields withdrew to their northern lair, leaving Scotland rough and gnarled and ice-hewn, but with a characteristic, strong, rich beauty of valley and hill, of mountain and flood, of loch and fiord, of promontory and island, that has given to our homeland a singularly sweet attractiveness, and a grave, stately charm above all other lands.

The end of this period, the age of the ice-king, saw the disappearance of much of the old flora and fauna and the incoming of the present forms of life, both animal and vegetable. Great forests of pine rapidly spread over Europe and America, covering the hills with a garment of sombre hue, and filling the deep valleys with yet a deeper gloom. Where now the green fields of England smile up to the summer sky, the mammoth, the woolly-haired elephant, the rhinoceros roamed through sedge and mere; while the North Sea restlessly rolls over the plains where herds of wild deer and oxen browsed in ample security.

It was at this period of the world's history that man entered upon his heritage, took possession of his wide dominions. Up to his coming all creation had been, as it were, working; for his advent it had been waiting.

What a change his coming wrought! True, at first he was a puny creature, one who stooped to earth and from it tore a sharp flint which he fashioned into a weapon of offence and defence; yet it is that same quick, deft hand, that same inventive brain, that has transformed our earth from pole to pole, from rising of the sun to the setting of the same. Man is mightier than all the glacier ages the world has seen, more destructive than fire or tide, more terrible than earthquake or tempest. He has set a girdle round the globe; he laughs at the sea; the mountains are no barriers to him; he casts a measuring-rod across the universe, and has dropped plummets into the deepest reaches of space; he places the sun and moon in scales and the stars into a crucible. His coming truly marked a new age in the world's story, and this age still stretches on, apparently without shadow of turning or sign of ending.

So far we have been reading aloud the story biology and her handmaid geology has to tell, and we have allowed the tale itself, as it ran on to its close, to be its own interpreter of the question, Is the earth old or young? We have heard that through long ages of development from mosses and lichens, through giant grasses and tree-ferns, we at length reach the palm, and finally such forest trees as the pine and birch and oak, and yet later on in time the fruit-bearing trees, each after its kind. Through untold periods, also, we may trace the evolution of animal life up and up, and yet ever upwards to higher forms. First a mass of almost formless jelly, a sponge, a shellfish, an armour-plated fish, a reptile. Then in process of time these stages yield an animal half-reptile, half-bird, from

which to the true bird-form is an easy gradation. Still later in time come the mammals, first low in the scale of life, then higher and yet higher, till at length man enters upon the scene, the crown and sceptre of this chain of 'beasts, and of fowl, and of creeping things, and of fishes.' The very fact of his supreme lordship over them proves his want of kinship with them other than nearness in time and space.

Thus far the story runs which biology has to tell. Is the chapter closed? To this biology can only give a halting answer. And to the question, What is the duration in years of each biological age? she returns no reply other than this, that the span which separates our present day from the hour in time when man appeared upon the scene of his future wonderful history is all too short to measure the immense abyss of time which stretches between the present and the dawning morning of life upon the globe. The biologist will grant us any number of years with which to reckon the earth's past. To him a million years is but a drop, and a million million years a mere fragment, of time.

Yet biology in connection with geology makes certain definite (if not numerical) revelations regarding the earth's age as a habitable world. It had a certain definite beginning, and it had this beginning in time. There was a date in the actual passage of the years, a physical instant, when life did not exist upon the earth for the simple reason that it could not. The earth was too hot, the rocks too molten, to support life. As soon as the earth became habitable, when the waters above the firmament were separated from the waters under the firmament, and dry land appeared, then, and not till then, did the gift of rudimentary life enrich earth's wide domains. This fact is writ large in the rocks that girdle our earth, and there is no controverting it. Life as we know it had a beginning, and it had that beginning soon after the earth passed from the plastic to the solid state. What the precise nature of that beginning was need not concern us here; indeed, speculation as to its character is idle. We know that at a certain date in time life was not on this globe, and that at a later day we find evidence of organic life—humble, simple, structureless life, it is true, but yet life. Between these two ages the stupendous change in the world's history took place.

As regards the date of this epoch-making event, the dawn of life on the globe, biology, as we have said, is silent. All she can assure us is that the age-long periods during which life on the earth passed through phase after phase of its evolutionary progress are to be measured by untold millions of years. Even as to the vaguest estimate concerning the duration of a single epoch—as, for example, the saurian age of great reptiles—we can obtain not the slightest hint from biology. She accordingly permits us to make any draft we like on the bank of time in which to account for the various progressive changes that have taken place in the vegetable and animal forms of past ages.

But besides this foundational fact of cosmic biology, that life has been evolved from the simplest forms, there is a second of equal importance. Progress from the lowest primitive stages of life to the highest complex types of the present day has been gradual and regular. There is not in creation a single reversion of development—that is, a distinct descent from a highly organised form to a simpler and more rudimentary type. Retrogression is apparently a manifestation of nature in its sick and feeble moods. Life unrestricted moves forward in a stately fashion, ever facing the line of march.

Is the earth old or young? In presence of this great law of development, we answer young and strong and full of rich and glorious promise. It is neither old nor decrepit nor exhausted, if we have interpreted rightly the tale imperial biology has to tell. On the contrary, it is at the entering in of a new age, the age of man's dominion.

His dominion! How much of earth still lies outside his control! How many great wastes are to be reclaimed, great marshes to be dried up, great forests to be levelled! How many problems, social and political and religious, has he yet to solve! How much of wrong has to be righted, and of things that have gone askew to be adjusted! And reclaimed and restored and settled the inhospitable places of the earth must one day be, unless we are willing to accept the position that for countless ages creation has been drifting arduously and painfully towards a half-completed and wholly unsatisfactory world. And solved the problems also will one day be unless we agree that they are there, tantalus-like, to annoy us by their existence. And the wrongs will be righted and the crooked things straightened 'in the good time coming,' unless through all time life will be hideous and the future hopeless to the great bulk of humanity. From such a sad belief may we be delivered! The golden age is in front of us, not behind us; and slowly, but withal surely, mankind gropes its way towards it. Yet there are those, some of them writers of eminence, who hold that progress is not an instinct of our humanity. Says one such: 'The entire Mohammedan world detests it. The multitude of coloured men who swarm in the continent of Africa detest it. The millions on millions of men who fill the Chinese Empire loathe it, and, what is more, despise it.' There is here a confusion of ideas. What many races dislike is the unnatural rush and push which is simply a passing phase of Western civilisation. All races desire progress—true progress. This yearning is a part of their manhood, an attribute of their nature, a compelling law of their being. Just as he walks erect, so man ever stretches his groping hands upwards, ever casts his look forward. Had this force no place in the economy of nature, men, all men, would through all time

be grovellers by sea-beaches, dwellers in caves, root-grubbers and carrion-eaters, fierce, lawless, debased, their lives a gray, grim, hopeless monotony. Instead of this, we have all through the new age which dawned upon the earth when man was created the same steady, upward, progressive movement which characterised the earlier periods of what is called geological time.

And now we come to the only vague indication that biology has to give regarding the possible destiny of our planet, a destiny worked out by this very trend towards an ever-increasing perfection of type, to the proof of which we have given so much —some may deem too much—room.

As mankind grows wiser and stronger, more able to subdue nature, and to chain or charm its destructive forces, it is evident that most of the factors which make for death and decay will be weakened. This is borne out by the census statistics of civilised countries, nearly all of which show a steadily increasing population. But this very tendency to preserve and enrich will ultimately bring the race to a strange pass; for, although population may increase, the area of habitable land is a fixed quantity; and, seeing that there are no colonial planets to whose shores the overflow population may be sent, sooner or later, unless destruction otherwise come, the question of elbow-room will arise.

Many years ago a famous statesman considered three acres and a cow to be the ultimate stage consonant with decent human existence. We may, in our desperate need, pare the limit a little finer, and make it one acre and no cow. That is, we take one acre of ground per head to be the limit of impoverishment to which we may submit the race without fear of certain starvation. Now, accepting the present increase in the population of Europe and America as a constant additive quantity, we find that in half-a-million years hence there will be moving upon our planet a living army of fifty thousand million souls. If we were to parcel the earth out amongst this vast multitude each man would receive a good deal less than one acre of ground, even admitting that we press into our calculations the inhospitable polar regions. Two million years hence each man will have a square yard of property to do with it as he pleases. The thought that naturally arises is, that he can only make it into a grave! We dare not speculate as to how the race will deal with this grave emergency. Indeed, our speculations, our visions, have already probably carried us too far. We may assure ourselves of this, that long before the press of over-population becomes a serious danger man will devise means of coping with it that lie wholly outside our present experience or knowledge. We are on absolutely safe ground when we aver that for at least a thousand centuries to come, no world-wide disaster happening, there will be room enough and to spare for all the sons of men. We are likewise taking grip of no unanchored hope when we see in these years a period of ever-increasing happiness for earth and the dwellers thereon, an age of peace and security and sufficiency for all.

HAUNTED HOUSES.

By VIOLET TWEEDALE.

IN these days of keen inquiry—when nothing is too sacred, nothing too grim, to be investigated by the elucidator of mystery—it is well for the author who selects as his subject the supernatural to walk warily. To be really successful, he must steer between the Scylla of the scoffing materialist and the Charybdis of the convinced believer, both of whom are lying in wait to rend him should he tread upon their susceptibilities. The same lofty disdain is maintained by each—the one towards belief, the other towards unbelief; both are inclined to toss a book aside directly it fails to fall in with one or other view of the situation. Perhaps the most remarkable sign of the times is the attitude of the modern editor towards psychic phenomena. Half-a-century ago, when scepticism was far more rampant than it is now, Lord Lytton wrote *A Strange Story*. To-day one hardly ever opens a newspaper without coming upon a paragraph dealing with the subject. Experts are respectfully invited to supply articles upon spooks and apparitions, and it is no longer the fashion to raise the silly cry of 'Superstition.' Not intellectual vigour but ignorant assumption is now ascribed to those who sneer at the laborious and careful investigations of men like Mr A. J. Balfour, Sir Oliver Lodge, and Sir William Crookes. If such intellectual giants consider these phenomena worthy of their earnest attention, if the Society for Psychical Research can number amongst its members numerous scientists of the highest order, it ill becomes the ordinary individual to arrogate to himself the right to cry, 'All nonsense.'

We, therefore, gladly welcome with an open mind the handsome volume Mr Charles Harper has produced and given to the world under the attractive title of *Haunted Houses* (Chapman & Hall). The blemish in the book lies in its author having failed to steer the requisite middle course; and one closes the pages with the conviction that he is a sceptic, though by no means an obdurate one. Curiously enough, he seems to have been wholly unobservant of

the strong modern tendency towards psychic research, and the vivid interest in the subject displayed by all sorts and conditions of men and women; for he remarks that the twentieth century is inimical to ghosts, and few now believe in the supernatural—the exact opposite being the truth. Again he says: 'The era of haunted houses has long been on the wane.' In order to emphasise this misstatement, let me relate a fact which will certainly be of interest to the investigator. No farther back than last December, a house mentioned by Mr Harper in his second chapter was the scene of the most terrifying experiences. The account was submitted to me, as to one interested in the so-called supernatural. The occurrences were narrated in the writing of one of the beholders, who penned them to an old friend. The events described took place on three successive nights, and were witnessed by a certain middle-aged lady, neither a sceptic nor a believer, but one of the many who are not interested in psychic phenomena. The second witness is a man of middle age, the head of one of the oldest and proudest families in England. It is impossible here to give the details of what happened or the names of the witnesses. Firstly, such an injudicious course would ensure the absolute boycott of the house and its unfortunate owner; secondly, it would bring down the most unenviable notoriety upon the unhappy spectators, who undoubtedly will take long to recover from the shock they experienced. The very fact that publicity in such cases arouses a tornado of journalistic fervour throughout the land, and sends an avalanche of curiosity-mongers to the scene, is sufficient explanation why really authenticated cases so rarely become public property or receive the scientific inquiry they merit. The late Professor Sidgwick remarked at the opening of the Society for Psychical Research that it was 'indeed a scandal that facts of such importance and such frequency should have gone so long without careful investigation;' but he hardly realised then the objectionable publicity incurred by those who rashly narrated their experiences, and people are naturally reticent regarding phenomena of a nature often most sacred.

In the case above mentioned sleep was out of the question. The noise made by what appeared to be an army of invaders continued throughout the night. At intervals there were clearly visible materialisations of men and women, who went through scenes of the most terrifying nature. It should be mentioned that the two witnesses, both guests, were no relation to one another, and occupied rooms in different parts of the house. The manifestations seemed to invade the entire premises. Both witnesses saw the same things, though exclusive scenes were accorded to each. The owner neither saw nor heard anything during those three nights, and was told nothing of what had passed till the forced departure of his guests made an explanation advisable. Directly he was alone he proceeded to investigate for himself, and was at once fully convinced by ocular and oral demonstration that what he had been told was only too true. The written description as submitted to me was bad enough; one shudders to think of what the actual beholding must have been. With three witnesses of such undoubted honour and integrity, and with three successive nights in which to pile evidence upon evidence, what is to be said? Were it only permissible to give names, the hardiest cynic would pause before committing himself to rank scepticism. For what it is worth, the explanation of the occultist may here be permissible. We are told that wherever any violent mental disturbance has taken place, accompanied by physical acts, wherever there has been felt emotions of intense passion—either of hatred, love, fear, agony, or sorrow—the violence of those vibrations has been intense enough to impress a faithful portrait of the scene upon the astral light (the invisible region that immediately surrounds us). A slight temporary increase of sensibility would enable any one to visualise the scene, and actually in detail see the event taking place before his eyes. The phenomena may also be produced, we are told, by the actual perpetrators returning in spirit-form to re-enact the same scenes they had created many years previously. As a criminal during life is known to recur mentally and continuously to the scene of his evil practices, and even to haunt the spot in person, so it is conjectured the man finding himself released from the body often produces a replica of a former action which has made a deep impression on his mind.

It is difficult to say exactly what constitutes the peculiar atmosphere that renders a house 'haunted-looking.' I remember very well visiting Dalham Hall, near Newmarket, with my husband, who wanted to buy a place in that neighbourhood. Mr Harper gives an account of the ill-luck that followed the Rhodes family after acquiring it—the three brothers dying within a very short time of one another. He mentions that the property went by the name of 'Unlucky Dalham.' I never heard this epithet applied to the place; but, though we visited it on a fine summer day, the sensation it conveyed of being uncanny decided us to leave it discreetly alone. It is thirteen years since I stood in the house, but I can distinctly remember being very much annoyed by the impression its atmosphere conveyed, as in other ways it would have suited us admirably. Without rhyme or reason, we at once decided it was uninhabitable. A brooding gloom hung over it, the reason for which one looked in vain, as the material conditions and surroundings suggested quite the reverse. Shortly before he died I asked Frank Rhodes how he liked Dalham. He replied quite seriously, 'Oh, it's a horrid, haunted old place;' but refused any further information, though his hostess, seeing he spoke in earnest, urged him to be more explicit.

Mr Harper deals fairly exhaustively with the celebrated Glamis Castle secret. What it was will never be publicly revealed, and it is generally understood that the tragedy or horror has terminated

finally within the last few years. There will never again be the necessity for the secret being imparted to the factor and held by three persons only. It must not be supposed, however, that the supernatural has finally abandoned the grand old pile. In 1904 certain events occurred in the presence of numerous persons who had assembled to go in to dinner, and a garbled version found its way into the daily papers. The manifestations were directly concerned with the gambling propensities of the first Lord Glamis. Mr Harper rightly terms the castle an 'abode of mystery.' A cousin (now deceased) of the family often described it to me as such, owing to the infinite variety of uncanny happenings he had known to take place within its walls.

Perhaps the most interesting part of *Haunted Houses* lies in the pages devoted to curses. Here we are on more solid ground, as we have history to demonstrate the reliability or otherwise of such maledictions. It is curious to trace how almost invariably they have borne fruit. The curse on Cowdray and Acton Reynald are excellent examples. Students of occultism have furnished us with an explanation which may prove reasonable to some, though utterly unconvincing to others. The instance of the monk who cursed Cowdray gives us a case in point. It is stated that hate, equally with love, can create a strong mental image or 'thought-form.' This force is powerful enough to reach and act for a considerable period of time upon the enemy who is hated. Occultists contend—in accordance with the belief propounded by the present Bishop of London—that when a man passes from life to so-called death nothing in him is changed save the casting off of the physical shell. It is, therefore, possible for him to sustain and even strengthen a strong thought of hate or love which will act upon the lives of the survivors. In the case of Newstead, though the specific curse is not handed down, one may be tolerably certain that many were mentally uttered by those who looked with religious fanaticism upon the sacrilegious actions of those who entered into possession.

Mr Harper devotes many pages to what are termed in Germany 'tales of the Poltergeists,' and it is just this sort of phenomena we read of so constantly in the daily papers. They consist of inexplicable noises and mischievous pranks. Mr Harper truly remarks that though human agency has often been found to be at the root of the mischief, 'there have been equally numerous instances that not the most searching investigations could convict of being produced by trickery.' In life we know that there are human beings at a stage of evolution where they consider such humbug amusing. Incomprehensible to the reasonable man as this attitude must appear, he may not be averse to acknowledge that the idiot who amuses himself thus in life may be little less idiotic after death. If he can only hit upon the psychic means to make himself thus objectionable, he will doubtless continue to exert this peculiar form of humour to the annoyance of the survivors. Occultists consider that the presence of one who is possessed of mediumistic faculties is sufficient explanation of such phenomena; and it is a matter of knowledge that once such suspected persons are removed all disturbances cease.

Mr Harper gives us many instances of what may be termed 'the family ghost,' the apparition of man or woman supposed to haunt a particular room or corridor. Mr Stead has furnished us with some apposite remarks upon this branch of the subject. He takes the phonograph by way of analogy. 'You speak into the phonograph, and for ever after, as long as the phonograph is set in action, it will reproduce the tone of your voice. You may be dead and gone, but still the phonograph will reproduce your voice, while with it every tone will be audible to posterity. So it may be in relation to ghosts. A strong emotion may be able to impress itself upon surrounding objects in such a fashion that at certain times or under certain favourable conditions they reproduce the actual image and actions of persons whose ghosts are said to "haunt."'

Undoubtedly *Haunted Houses* is a book of strong interest, for though the scoffers and sceptics are still rampant in the land, they now no longer have things all their own way. They are confronted with the materialisations of several weekly and monthly periodicals, which by their continued existence prove the undoubted fact that man is becoming more alive to the truth that his conceptions of the unseen require to be deepened and broadened. Intellectual men are beginning to see that the whole aspect of the subject changes when they once determinedly set forth to apply the principles of continuity and evolution from the known part of the universe to the unknown.

THE PAINTER.

He was a landscape-painter
  Of a genius all his own;
From far-off lands he came to me,
  And a country quite unknown.
He stirred my soul as no one else
  Can ever hope to do;
I watched him paint, and humbly tried
  To learn some lessons too.

His colours I have never found
  In any box I buy;
The imitations only make
  A poor and hideous dye.
He makes all lovely ugly things
  With his most magic brush,
The whitest rose he smiles upon
  Is almost made to blush.

I gaze upon his works of art,
  Enraptured by each one;
But conscious that I'm only I,
  And he's my lord—the Sun!

IN PRAISE OF GOOD FOOD.

By F. G. Aflalo.

WHEN Douglas Jerrold spoke of the 'greatest animal in creation, the animal who cooks,' he put his finger on the abrupt dividing-line between man, or at any rate civilised man, and the hairy apes of the jungle who are regarded by scientific folk as first-cousins of Napoleon and Rudyard Kipling. Those modern faddists who make three sumptuous meals a day on pine-kernels and patent foods have a nasty habit of sneering at us of weaker flesh who gratefully recall memories of wonderful dishes under many skies. If I ruminate once more over a prawn-curry at Mount Lavinia, an iced peach at Delmonico's, a meat pastel at Port of Spain, or a dish of flying-fish at Bridgetown, I incur their contempt. Yet there is certainly the instinct of the fox looking up at sour grapes in those who declare a half-cooked steak or a mess of boiled mutton and caper sauce the peer of any masterpiece of Carême. It passes the understanding why a proper artistic interest in food should be less decent than intelligent appreciation of a beautiful landscape or masterly painting or tremendous oratorio; or why, of all the gifts of the gods, the sense of taste should be so deprecated that he who openly delights in colour or harmony or sweet perfumes should profess indifference to the flavour of a ragoût or the bouquet of a vintage.

Not all one's memories of meals are grateful, for some are curious and others sorrowful. At the opposite poles are a well-ordered meal at, say, Sherry's in New York, and a banquet once given in my honour by a Moorish chieftain who has lately joined the claimant to the throne of Abdul Aziz. In the American capital fifteen or twenty dollars soon go when taken out in soft-shelled crab, Baltimore terrapin, canvas-back duck, and a cunning sweet; and this even though only water, either still or aerated, is drunk at the majority of tables, the American drinking less spirituous liquor at his meals (and more between them) than the men of any other civilised race.

At the Moorish table—which is no table, but merely a part of the floor—quantity takes the place of quality. We squat tailor-fashion on the ground, and negro slaves of both sexes file in with dish after dish, each covered with the familiar dome of plaited straw. Each slave uncovers a dish and tastes the contents (dipping the hand in the viands for the purpose) to show that there is no poison; and it occurred to me at the time that if such a plan were adopted in English seaside lodging-houses either less poison would be placed on the table or parlour-maids would be at a premium. After the fashion of the ancient Hebrews, the mainstay was a square of Moorish bread (which contains more grit than flour) dipped in the gravy of kid or fowl, which formed part of the contents of all the dishes. Once or twice mine host, to do me special honour, thrust a reeking crust with his lean fingers between my not too yielding lips. Then came the more serious tearing of the flesh, each one for himself, and all ten fingers to the rescue; the meal concluding with little cups of green tea, syrupy with sugar and strongly flavoured with mint, or, as an alternative, a decoction of chicory flavoured with coffee and spices.

Such Eastern orgies, in which fowls are served in flocks, and kids all but whole, recall the gastronomic perspective of a vanished generation, such as the Highland feast described in *Waverley*, in which a yearling lamb was roasted whole and dished up on all-fours, or the tremendous holocaust we read of in Lever's *Charles O'Malley*, with its gigantic turbot, its sirloin that might have supported a rhinoceros, its half-gallon flask of whisky, and huge decanters of sherry and port. At the other extreme was the frugal garbage served up by the faithful retainer to the Laird of Ravenswood and his unfortunate guest and fellow-sufferer.

To-day we prefer quality to quantity, and a well-cooked dinner is the triumph of mind over matter. Above all, we realise that heavy meals are for the dining-hall, and are unsuited to the picnic or shooting luncheon. In our picnics compression is the rule, and sandwiches are preferred to the dusky loaf smelling of home, the half-pasty of

 [*All Rights Reserved.*]

lark and leveret, and the flask of prime cider, of which Tennyson sings the praises in *Audley Court*. The sportsman, constrained to take his midday meal in the open, is all for despatch, and men who go out to shoot and not to feed would far rather make short work of a packet of sandwiches and the contents of a pocket-flask, cowering in the lee of a hedge, than sit down in a farmhouse to an elaborate repast of hot and cold dishes, followed by port, coffee, and cigars, wasting the best of the afternoon over a meal more appropriate to the evening.

Food eaten *al fresco* always tastes better than indoors; hence, no doubt, the popularity of the picnic as an institution and the glamour of the camping-life. The common blackberry, eaten raw, is an unpretentious fruit that could, on the civilised dinner-table, attract only the most unsophisticated palate; yet how delicious may it not taste fresh gathered from the wayside hedge! A rosy apple eaten in its native orchard may taste more delicate than any hothouse peach or nectarine at a City banquet. Camping in the foothills of the Atlas, with a young moon sailing over corries overgrown with prickly pear and oleander, we used to think the soups compounded by our Moorish cook from the lean fowls brought in by tribesmen more delicate than any purée at the Carlton; yet doubtless they would have tasted but sorry stuff in a setting of white napery and shaded incandescent lights. Another tent of mine was once pitched four days and nights on a tiny island in mid-Atlantic, with the surf booming almost to the tent-pegs, and our Portuguese cook, a native of Madeira, used to make so savoury a hotch-potch of the half-dozen kinds of fish which we caught daily in the trammels that I have never ceased to regret the lost secret of his magic. In the sauce, by the way, there was always half a bottle of Madeira wine, and a better stock for fish-sauce is not brewed.

Fish I have eaten all the world over—salmon of Tweed and trout of Corrib, tunny in the Mediterranean, red mullet wherever they could be caught or bought, spada at Madeira, snapper in Australia, and the quaint medley of *frutto di mare* (largely crayfish and red mullets) which is the backbone of a Marseilles *bouillabaisse*, to be had at an eating-house at the very bottom of the Cannebière—and all are in their way above praise. Yet I doubt whether any could rival the delicious flying-fish as served to me two years ago in the club at Bridge-town. In a wind-swept island not remarkable for such inducements as some other ports of call hold out to birds-of-passage to stay their flight, this supreme dish was unique, and not to be missed even by those whose steamer makes a stay of only a few hours in the roads. It was better requisitioned by cable than untasted. The cooking was a triumph of simplicity. The fish, caught fresh each night, were just fried crisply and served hot; and, with a mere squeeze of lemon and a dusting of Nepal pepper over the 'wings,' the happy man who secured a large dishful for himself might have been devouring birds-of-paradise. Alas! my praise is reminiscent, for I had another flying-fish, a single one this time, last summer, and it might have been a stale herring! And there are folks who make light of the sacred magic of good cooking!

Every land has its kitchen ideals, and it is the happy temperament of the curious and contented traveller to think the present always best. The cooking of Germany, which is as solid as the cooks, did not, during a year's residence, leave much to be thankful for; but there was, at Christmas-time, a roast of turkey, stuffed with snipe and woodcock—the game-birds being afterwards removed, though their flavour remained in the more insipid flesh of the farmyard fowl—which would have been no bad subject for a poem. At any rate, it was better than the boiled mutton and capers which are the unintentional insult of the hospitable on Sundays in provincial England. Other dishes I could enumerate, the wraiths of which lie venerated on the 'table of my memory.' A roasted 'lappe' or a mess of 'pepperpot' from Trinidad and a dish of river-shrimps from New Orleans would make glad music in my heart even in jail.

Liquid food, appreciated, like the rest, in strict moderation, should not lack its niches in memory's temple. The soundest rule is to enjoy the produce of the country in preference to imported vintages; though that does not apply to England, where, with no native wine above the awe-inspiring brew of the elderberry, the best draughts of other markets can be had with some money and more judgment. It is surprising how well a wine or cordial attunes to its proper surroundings. A glass of old madeira at eleven in the morning (and perhaps a second at a quarter past) would wholly demoralise the stomach in foggy London, but is delightful in your hillside *quinta*, when the sledge waits at the gate to run you down in less than no time to Funchal. So, too, you will not decline the small glass of mellow rum, or even the thimbleful of 'pimento dram,' pressed on you during your morning ride by some hospitable pen-keeper in the flowery heart of Jamaica, though you might scout such temptation at home. Ride an hour or two among the hills of Tuscany, and you can drink a whole flask of the weak, harsh chianti, one glass of which would chill the stomach in a London restaurant. The rawest of cider goes down well after a hard day's shooting in Devonshire; and overproof whisky (from never mind where), mixed with a little crystal water from a hurrying burn, is better than vintage champagne when you are breathless on the hill.

The fitness of any food in its proper setting must be admitted only with due allowance for the mood of the consumer. The simple whiting, boiled in all its unattractive homeliness, is disgusting to the epicure in robust health; yet the convalescent gladly gives it hospitality after a spell of still more insipid nourishment. Even a well-compounded 'Irish stew' is a toothsome lunch-dish on a winter day; yet it would bring thoughts of murder if tendered

to a sufferer on a breezy morning half-way between Dover and Calais.

Between a scientific and æsthetic appreciation of good cooking and the quantitative greed of the hog there is immeasurable difference; but it is certain that contempt for food properly served is not so much proof of intelligence as of reversion to the gastronomic standards of the brute. Not the tensest moments of life free us from the pangs of hunger. Lovers cannot live on air, and even old Priam, in the throes of mourning his beloved son, was urged by Achilles to have a bite of the tender wether killed and roasted for the refreshment of the bereft and aged king.

DRIFTWOOD.

CHAPTER III.

THE acquaintance thus auspiciously begun ripened rapidly. Sir Hugh, who was an enthusiastic fisherman, found in Cathcart a congenial spirit, and the two grew intimate over those mysteries of flies and worms so dear to every faithful disciple of Izaak Walton. Long days were spent in excursions to some distant reach of the river, on which Muriel often accompanied the enthusiasts, for she threw a line well, and her share in the day's sport was no unworthy one. Sometimes, too, rod and line were laid aside, and the three sat 'yarning,' as Sir Hugh phrased it, or Muriel would delight the two men with the fund of gay chatter which flowed so spontaneously from her lips. Although, as he almost contemptuously reminded himself, schoolgirl manners and a milk-and-roses type of beauty were 'not his style,' Cathcart was attracted in spite of himself. Had he known it, Muriel looked upon him as her father's chum and contemporary, and the friendliness she extended to him on that account was so perfectly natural and without *arrière pensée* that the man who had deliberately set himself to win her found himself foiled and baffled by her innocent unconsciousness of anything of the kind. His scant success was, of course, unknown to Harry Markham, who in the meantime was torturing himself with a thousand groundless fears. From the moment of their first meeting the young man felt an instinctive distrust of Cathcart, and the feeling lost nothing by being kindly harboured. Truth to tell, Cathcart had not been anxious that Markham should like him. A very short observation of affairs was enough to show him that the young man was a possible, if not exactly a dangerous, rival, and that if he could contrive to keep him out of the way his own course would be the clearer. He was, when he chose, a brilliant talker, who had apparently been everywhere and seen everything, and on the few occasions on which they had met in company he had taken the advantage of his opportunity to throw the young soldier into the shade as much as possible.

Madge Markham was still away, and Harry's own powers of resource having failed him in the face of such unforeseen opposition, Cathcart to all appearances held the game in his own hands.

The summer waned, and matters still remained in this state, save that, in place of the fishing expeditions, Cathcart accompanied Sir Hugh and his daughter when they met the hounds in the early morning at the covert-side. Added to his other accomplishments, Cathcart was a fine horseman; and the baronet, who had a sportsman's love of seeing a good rider and a good horse in conjunction, felt genuine pleasure in offering mounts from his own stables, which were gracefully accepted. Muriel herself was a bold and fearless rider to hounds; and Cathcart, whose nerve was as perfect as his horsemanship, lost nothing in her eyes when in the saddle.

About the end of October Madge Markham returned to Western, and the event was at once the signal for the passage of notes between Western and Thorpe Somerville, for Madge was anxious that her friend should spend a long day with her at the earliest possible date. Colonel and Mrs Markham were still on the Continent in search of a permanent cure for gout, and it was three months or more since Muriel had been at Western. The old links were so completely broken that when the morning of the day came on which she was to leave her father, she felt almost as if she were deserting him, and strangely loath to go.

'What will you do without me all day?' she asked, dropping a light kiss on the top of his head as he sat in the little room he called his 'study,' surrounded by a heterogeneous litter of fishing-tackle, spurs, and hunting-crops, pipe in mouth, cleaning his favourite gun.

'My dear, I don't know! Cathcart was to have gone with me up to the Fairy Pool to have a shot at the duck; but he has just sent a note to say that important business has taken him up to town. I suppose I must go alone and see if I can manage to shoot something. I might take Western on my way back, and we could come home together.'

'Oh, I wish you would!' the girl cried, so eagerly that Sir Hugh looked up.

'Don't you care for Harry as an escort, then, little girl?' he asked, smiling.

The quick colour rushed to Muriel's cheek as she replied impetuously, 'I can't bear him, father, and I don't want him to bring me home! If you don't come to Western, do send the carriage for me!'

'Drive your own cart if you care to go round by the road. But what is the matter with Harry? He used to please you, didn't he?'

'He doesn't please me now,' Muriel said. 'Lately he's been so dull, almost grumpy, not a bit as he used to be.'

'Dull—grumpy—eh?' Sir Hugh gave a little laugh. 'Poor chap!' he added under his breath.

Muriel turned round quickly. 'Why do you say that, father?' she asked. 'He seems to do without us very well. You know we never see anything of him now.'

'I'd noticed that. Well, why is it?' He had to wait some time for his answer, but it came at last.

'I think it is partly because he does not like Mr Cathcart,' she explained.

'If *you* liked him,' Sir Hugh said quietly, 'I don't imagine he would care much about Cathcart's opinion.'

'Ah, well,' returned the girl, 'it doesn't matter anyhow, does it? You'll come and bring me home, daddy, won't you?' she added coaxingly.

Sir Hugh nodded a laughing assent. 'Stay a moment, little girl!' he called as the door almost closed on Muriel's retreating form. She came back half-reluctantly, and stood waiting, her father watching her the while, a quiet smile on his face, yet with a deeper meaning underlying his joking words. 'Your old dad's a bore, isn't he?' said he, 'especially when he's got something to tell you that you don't particularly wish to hear. I want to remind my little girl that Harry's a very good fellow, and she may be sorry some day if she hurts him too much now. Off you go! My love to your friend Madge.'

Without another word Muriel turned and went. If Sir Hugh's words had made any impression upon her, it was not destined to be proved immediately; for Harry did not appear at the luncheon-table, and Madge explained his absence by saying that he was shooting with a neighbour, and would not be home until late in the afternoon. The short autumn day closed in rapidly, and drawing their chairs closer to the fire, the two girls bridged over the weeks of absence by a long confidential chat. So absorbed were they that they did not hear a step in the hall, and both started when the door opened and Harry's figure showed in strong relief against the firelight. An involuntary expression of disappointment escaped Muriel.

'I thought you were father,' she explained half-apologetically. 'He went to the Fairy Pool, and said he might call here on his way back. Haven't you met him?'

'No,' replied the young man; 'I've been shooting with Lumsden, and that's the other way, you know. The light has been gone this last hour, and at the Pool it would be dark at half-past three. Sir Hugh would know that Madge would not let you go so early. I shall be happy to take you home when you wish to go, if you'll let me.'

Muriel coloured, but accepted the offer with alacrity. Sir Hugh so seldom failed to keep even a trivial appointment that, for once, she was assailed by nervous fears. Madge made no further attempt to detain her, and in a very few minutes the good-byes were said. Afterwards she remembered that Harry had gone without his tea.

Less than a quarter of an hour's brisk walking brought the lights of Thorpe Somerville into view, and Muriel hastened on with fresh vigour. During the walk Harry's well-meant attempts at conversation had met with small encouragement; his companion was obviously preoccupied, and paid perfunctory attention to his efforts. At the hall door the old butler met them, the mute inquiry in his face changing to alarm as he saw who stood there.

'Is Sir Hugh in the study, Burton?' Muriel asked quickly.

'Sir Hugh 'ave not yet returned from shooting, ma'am,' the old man replied. 'We expected he was at Western Hall with you.—Perhaps'—looking at Harry—'you may have seen him, sir? He was going to the Fairy Pool.'

The young man shook his head. 'I've been shooting all day with Mr Lumsden, Burton,' he said, 'and only got home at five o'clock.—Do you suppose,' he went on, turning to Muriel, 'that your father would stop at The Lodge? He may have wanted to see Cathcart about something.'

'Mr Cathcart was going to town to-day. The last train does not reach Thorpe until ten minutes to ten. Of course he could come by the express, and drive from Raventree.'

'Well, I'll call at The Lodge as I pass, on the chance,' Markham said cheerfully; 'but I expect you'll see Sir Hugh long before I do. I dare say he's down at the home farm.'

The old butler made a gesture of dissent. 'We have already inquired, sir,' he said with dignity. 'Sir Hugh has not been at the home farm since ten o'clock this morning.'

'Well, I'll go down to Mr Cathcart's and tell Sir Hugh you're expecting him.—Good-night, Muriel.'

'Good-night!' the girl called after him clearly—'good-night, and thank you!' She went into the house; but Burton ran down the steps after the young man, and touched him on the shoulder.

'Captain Markham, sir,' he whispered, 'if the master shouldn't be there you'll come back and let us know? There's no My Lady; and Mrs Perkins, the housekeeper, she have nerves, sir; and Miss Muriel be but a bit of a girl.'

'And I believe you're only an old woman yourself, Burton,' the young man said, laughing. 'Of course I'll come back. But don't meet troubles, man! Go and tell Mrs Perkins to look after Miss Muriel, get her some tea or wine or something, and see that the cook has dinner ready for Sir Hugh when he does turn up. And good-night to you.'

He disappeared into the darkness; but the old man remained standing on the steps until the last sound of his feet had died away, straining his ears in vain for that other well-known footfall that never came.

Markham, with his long, easy stride, covered the mile between Thorpe Somerville and The Lodge,

which was really the Dower House of Western, in something a little over ten minutes. Cathcart had obtained a coat of paint from the agent for the outside of his new residence, and the entrance-gate shone white against the dark background of trees and overgrown shrubs that bordered the approach to the house. Stumbling up the moss-grown carriage-drive, Markham reached the front door, and after groping fruitlessly for the bell among the ivy that hung untrimmed over porch and walls, at last beat a sounding tattoo on the heavy, old-fashioned knocker. No lights shone from the windows, either too closely shuttered, or else, as the young man at once concluded, because the master of the house was still absent. The whole place, as far as the darkness admitted of judging, had an eerie, unkempt, and uncared-for appearance that struck a depressing chill. In spite of five and a half years' service by night and day among the mountain passes of northern India, the young soldier experienced a distinct feeling of relief when, in response to his third vigorous assault on the knocker, steps were heard crossing the stone hall, and a faint gleam of light stole from under the door. A bolt creaked in its socket, a chain clanked against the iron-bound door with a crash; at last the key grated in the lock, and the door swung open a few niggardly inches, through which Markham could barely discern a figure which he took to be that of Cathcart's man-servant.

'Is Mr Cathcart back yet?' he asked. 'If he is, will you tell him Captain Markham would like to see him for a minute?'

'He—he's—not in.' Cathcart's man evidently had an impediment in his speech. The voice had a strangely familiar ring. Where could he have heard it before? Meanwhile he noticed that the chink grew perceptibly narrower. It was quite certain that in Cathcart's absence Sir Hugh would not be there, and Markham turned away with a cheery good-night. The courtesy evoked a grunt by way of response, followed by the instantaneous slamming of the heavy door and the shooting home of the bolt.

'Surly chap, that man of Cathcart's!' Harry thought, more amused than annoyed. 'I wonder where I've heard that voice before.' No recollection came to him; and he was still puzzling over it as he retraced his steps to the Hall, according to his promise to old Burton.

CHAPTER IV.

THE Fairy Pool was indeed, as Cathcart had jestingly termed it, 'a sort of No Man's Land.' It lay on the edge of a wood, fringed by willow-trees and sedges, quite out of the beaten track, and only approached by a slender path which any one not acquainted with the neighbourhood might easily overlook.

Although knowing it well, Markham slipped and stumbled on the damp earth in the darkness, his face whipped by stray bramble-sprays, which considerably impeded his progress.

'Fairy Pool, indeed!' he muttered. 'Imps' Pool would be a far more appropriate name! Confound it!' as a more than usually prickly branch caught him across the chin.—'How are you getting on, Burton?'

The old butler, trembling with apprehension and the unwonted exertion, paused to regain his breath. 'Eh, captain,' he quavered, ''tis a God-forsaken place! You don't think, sir, that Sir Hugh's still here, do you?'

'I don't know what to think, Burton, and that's the honest truth,' returned the young soldier as he emerged at last into the clearing.

The pool belied its name even in broad daylight. But now, under the fitful moonbeams, it lay like a great, mocking eye, fringed with the black of the tree-shadows; and there hung round and about it, as the two men instinctively paused to look at it, something weird and strange and sinister which struck a nameless chill to the blood.

With an effort Markham shook himself free from the spell, and calling to Burton to follow him, groped his way down to the water's edge. A rat or some night-bird plunged into the pool at his feet; and at the sound, eerie in the blackness, his heart leaped in his throat, while at his side the old man gave a terrified whine.

'It's all right, Burton,' Markham said with a half-laugh, which sounded strangely out of place in the grim silence, and turned to follow the path which the moon, newly escaped from behind a cloud, showed like a gray ribbon running into the dark. The water lapped drearily on one side of them, sucking in and out among the reeds; on the other, the dead leaves floating through the little wood rustled and moaned like disembodied spirits. Markham's thoughts went back swiftly to the girl he loved, waiting alone in the great, silent house, and his heart ached for her.

Panic, born of the night and of the silence that was no silence, but full of mysterious sounds, again seized the old servant, and he caught at Markham's arm. 'What can have happened to my master? What can have happened?' he wailed.

Harry tried to laugh, but the attempt was a ghastly failure. 'Oh, come, come, Burton, this won't do! Nothing, I should think. Most likely he's given us the slip, and is safe at home by now. Of course he may have fallen and hurt himself, sprained his ankle, or something. By Jove! we'd better shout. Why didn't I think of that before?'

Their voices rang out into the night; but only the echoes from the nearer hills answered, and soon the silence settled down again.

Markham went on, moving his lantern from side to side, when suddenly, at an exclamation from his companion, he turned, to see Sir Hugh's game-bag in Burton's trembling hand. The last hope died away in the young man's mind, but he feigned a

cheerfulness he was far from feeling. 'Come along, Burton; he can't be far off now.'

'As far as the next world,' muttered the old servant, his terrified face gray in the moonlight.

Harry turned quickly round and went on, flashing the light before him; and in a moment, under the shadow of some willow-bushes, he came upon the end of his search. Sir Hugh lay apparently just as he had fallen, close to the water's edge, his gun half-under him, his quiet face turned to the watching stars.

Instantly Harry was on his knees by the dead man's side, his hand over the still heart, where the little, singed round of cloth showed only too clearly how the life had gone.

'Eh, deary me, deary me!' broke in the moaning voice of the old man; 'who'd have thought that it should come to this, and he the best master ever a man had?' He stopped, as if waiting for a reply to the question that indeed needed none; but Markham, looking up from his ghastly task, noted silently that into the old man's scared face crept a look of sudden comprehension. A weird figure he was indeed, as he stood there in the moonlight, bare-headed, the tears streaming down his wrinkled cheeks. 'Eh, captain, that I should live to see the day that I could think it! But a dreadful thought's just come to me—in the presence of him that's gone.' He jerked his trembling hand with an expressive gesture in the direction of the silent form, and drew nearer to Markham as he whispered, 'Pray the Lord, sir, that Mr Hugo have nought to do wi' this!'

'Mr Hugo!' repeated Markham in blank bewilderment. 'Why, Burton, he's been lost sight of for years. No one knows where he is.'

'Asking your pardon, sir'—and the old servant came closer, as if the woods might hear, and, hearing, echo his words—'he's not a hundred miles off, and that I can swear, to my sorrow.'

'Here, in Thorpe Somerville? Why, when have you seen him, Burton?'

'I know as how we should be doing and not talking, sir; but I've seen Mr Hugo, and I must tell you about it. Maybe you'll know what's best to do for poor Miss Muriel and us all.'

'Be quick, then, man; tell me what you know! You've seen him here, and lately, you say?'

'Not once only, nor twice, sir, skulking—that I should come to say it of his father's son!—about the grounds, and once in Raventree market-place, altered, as some might say, out of knowing, but not to me that knew him as well as I know my own right hand, and have been servant in the family for forty years come next Michaelmas.'

Patiently Harry waited until the old man had mastered his emotion sufficiently to proceed with his tale.

'The man Miss Muriel met in the lane—that was him, sir. The old dog knew him, and I was as certain as if I'd seen him with my own eyes when I heard as how his voice reminded her of one she'd heard. What wonder, when 'twas her own brother?'

'You've told no one?' Even to himself Harry's voice sounded harsh and strained.

'Nay, sir, I've been as still as him that's lying there, and wouldn't have spoke of it now, only the police will be coming about, and things might get to their ears. You'll know what to do, sir, better than I can. You don't think he'd ever have done it, do you, sir, no matter what there was between 'em? His own father!'

But Markham had no consolation to give, no answer to make.

(To be continued.)

THE PIONEER OF MODERN TRAVEL.

THOMAS COOK, BORN NOVEMBER 22, 1808.

By R. Seymour Ramsdale.

IN one of his letters, written from Paris during the Exhibition year of 1878, the late George Augustus Sala, after referring in terms of high praise to the management of 'Cook's Tours' to the French capital, went on to say: 'I think I first met him [Thomas Cook] at Venice in 1866. It used to be the fashion to sneer at and disparage "Cook's Tourists;" and the late Charles Lever, as "Cornelius O'Dowd" in *Blackwood's*, once went out of his way to libel in a very cruel and uncalled-for manner the travellers who were trotted round Europe under the auspices of the "personal conductor." Mr Cook has got over all that long ago, and can afford to smile at his detractors and forgive the shade of Charles Lever.' Of a truth, the great pioneer of modern travel came to have the laugh on his side, and to leave a name behind second only to that of George Stephenson, of whom, almost the contemporary, he was a truly worthy follower. From beginnings the most humble, he built up a mighty organisation which to day marshals more than four million travellers annually to every part of the globe, and furnishes employment to upwards of three thousand persons.

On the 22nd of November, just one hundred years ago, at Melbourne in Derbyshire, was born this Thomas Cook, whose name was destined to become even more famous than that Cook who was the first to circumnavigate the globe. Nothing was there in his surroundings, however, to presage future greatness. His father, employed in humble capacity on the estate of the first Lord Melbourne,

dying when the boy was but in his fourth year, his prospects were indeed of the slightest. At the age of ten he was already a wage-earner at the munificent pay of one penny per day, after receiving only the merest fragment of schooling. One chance, however, came in his way which seldom then fell to boys in his condition of life. For means of livelihood, his mother kept a shop, a very small one, and amongst the goods she sold were a few books, mostly such as were used in schools. To these the child applied himself with avidity, and thus managed to enlarge and extend the meagre share of education which had been his portion. From the first his soul was possessed by a 'noble discontent' and the notion that he must go forward and never stand still. The first step on the ladder was to persuade an uncle who worked as a wood-turner to take him from the fields to his work-bench, and at this craft he soon became an expert. Still, this was but one step, and not quite in the desired direction, for he had less time than ever for his books. Having often to make the journey to Loughborough for his master, he had many a time gazed with longing eyes at the shop of Joseph Winks, a printer, from whose press issued many of the books published in connection with the General Baptist Association. After much assiduity, he persuaded his uncle to release him, and, more than that, induce Winks to take him as apprentice. That he must have thrown himself heart and soul into his new vocation, and had within him some wonderful latent capacity, is evident from the fact that before he was twenty he had received the appointment of Bible-reader and village missionary for the county of Rutland. What a worker must this youth have been! Already, if but as a pedestrian, what a traveller! In his diary—a work he began when but eighteen—for 1829 he records that during that year he had covered two thousand six hundred and ninety-two miles, of which two thousand one hundred and six were done on foot. In his twenty-fourth year, having married, he set up in business for himself at Market Harborough, at his first trade of wood-turning.

Soon after he entered with his usual ardour into a movement of whose principles he had all along been an exponent: that of temperance. Having become secretary to the South Midland Temperance Association, he printed and published a number of pamphlets on the question, and in 1840 founded the *Children's Temperance Magazine*, the first publication devoted to the advocacy of that cause.

One hot summer day in the June of 1841, young Cook set out on a walk which was to mark the turning-point in his career. It was to Leicester, where he was to be one of the speakers at a great temperance demonstration. The distance was but fifteen miles—a mere nothing to such a pedestrian as he was; but as he strode along he read something which set him thinking deeply. It was the newspaper report of the opening of that portion of what was then known as the Midland Counties Railway, which connected Leicester with Loughborough. Now, it had been arranged to hold another demonstration shortly at Loughborough, and all at once it flashed into his mind what a wonderful success it might be made if the people could go by rail instead of having to walk; hundreds might then go where dozens would not otherwise. Full of the idea, he explained it to his audience that night. All were struck; but said some, 'What about the cost? How many working-men could afford it?' 'Leave that to me,' exclaimed Cook. 'All of you who would like to go hold up your hands.' So full was the response that early the next morning he betook himself to the office of John Fox Bell, the then secretary of the railway company, and unfolded his plan. It was that he would guarantee to fill a train if the company would take the people from Leicester to Loughborough and back for a shilling. Mr Bell at once fell in with the idea, and himself gave a contribution towards the preliminary expenses. Within a few hours the arrangements were set forth in print, thus making it the very earliest publicly advertised excursion train. This done, Cook went on to Loughborough to arrange for the feeding of his party. On the 5th of July the excursion duly started, numbering five hundred and seventy passengers, amidst great popular enthusiasm, a band of music accompanying them to the station, whilst all Loughborough turned out to welcome them. Thus was inaugurated a new era in the world of travel, and an object-lesson set before the railway companies as to the power of small profits and quick returns. In no long time the new organiser was inundated with applications for advice and assistance by those who desired to arrange for special trains.

During the summer of 1842, and two years following, he followed up his system with characteristic energy and remarkable success, arranging a great number of excursions of temperance associations and Sunday-schools between various points. The fares were such as but a short time before would have been deemed perfectly ridiculous, and so they would have been had not the number of passengers been so large. As an example, he took four thousand four hundred people from Leicester to Derby and back in the September of 1843 at a charge of one shilling for adults and sixpence for children. All this time gratitude and growing fame had been his sole reward, for he made not a penny for himself; but in 1844 he took thought that he might strike out for himself as a carrier of travellers. The theory he quickly reduced to practice, and interviews with the directorates of the railways of the Midlands brought about agreements to place trains at his disposal whenever he desired. Then he set to work to organise an excursion on a more ambitious scale than any hitherto attempted. When, in the early summer of 1845, folks read the advertisement of Mr Cook's pleasure trip from Leicester to Liverpool by rail, thence to Dublin and the Isle of Man by steamer, and back, for fourteen shillings

first class and ten shillings second, they fairly rubbed their eyes in astonishment; but the excursion proved a splendid success. So thorough was Cook's grasp of the conditions needful to ensure success that he became the compiler, printer, and publisher of what stands as the very earliest illustrated travellers' guide-book, a little volume describing all the places to be visited and many of those *en route*.

Although the thing was as complete a novelty as was the journey of the 'Rocket' from Liverpool to Manchester sixteen years before, it was fully successful. All the tickets were sold a week beforehand, and so great was the desire to obtain them that many were resold for double the money. Moreover, all were satisfied, so thoroughly had their comfort been ministered to. Still more ambitious was the next attempt, for the difficulties appeared at first quite insuperable. 'From the heights of Snowdon,' Cook records in his diary, 'my thoughts took flight to Ben Lomond, and I determined to get to Scotland.' But *how* to get there was the question, for the English railways then terminated at Newcastle-on-Tyne, and he had to make two preliminary journeys before the plan of campaign was decided upon. In the end it was determined that the journey should be made by rail to Fleetwood, thence to Ardrossan by steamer, and from that point on again by rail to Glasgow or Edinburgh. Although the entire distance to be covered was not less than six hundred miles, the charge was only a guinea per head, and the trip turned out as great a success as any of its predecessors. At both the great Scottish cities the 'personally conducted' and their mentor were received with the firing of cannon, musical honours, and great popular enthusiasm. At Edinburgh they were entertained at a public banquet presided over by William Chambers, who warmly welcomed Cook and his party to the capital of Scotland. Before the end of 1850 Cook had perfected arrangements with all the leading railways of the United Kingdom, and become the indubitable founder of the modern holiday system.

Now came the time to carry these conquests beyond the seas, and the great Exhibition of 1851 (which as much as any man he helped to make a success) being closed, Cook commenced to organise the invasion of Europe. Having first, in accordance with his invariable practice, gone thoroughly over the ground to be visited, he issued his advertisement of a 'Grand Circular Tour on the Continent.' Eagerly was such opportunity embraced by numbers who once would almost as soon have dreamed of a journey to the moon. Starting from Harwich, the expedition in succession visited Antwerp and Brussels, went over the battlefield of Waterloo, steamed on the Rhine, and returned home by way of Paris, Havre, and Southampton. This new enterprise once set agoing, Mr Cook never looked back, and within a few years there was scarce any region of the civilised world which had not been visited by 'Cook's Excursionists.' Lever and others might carp and sneer; but, all the same, folks continued to go in ever-increasing numbers, and soon there was not a railway or city in Europe where Cook's tickets and coupons were not available.

It was in connection with great Exhibitions that some of his most notable triumphs were scored. He was the making of the Exhibition of 1851 in a pecuniary sense, and in 1862 he not only conveyed to London from every part of the kingdom over twenty thousand persons, but housed and fed them during the term of their visit. To Paris in 1878 he piloted seventy thousand persons from our shores, and actually paid over to the French Government a sum amounting to one-thirtieth of their total receipts from the Exhibition. When first dealing with his European tours, one of the greatest difficulties he had to encounter was the apparent almost universal impression which obtained in Continental towns that Englishmen were made of money and could be bled with ease and impunity. This, like almost all other difficulties to be encountered, he soon contrived to surmount by unfailing courtesy, fair dealing, and resolution. A striking instance of determination and resourcefulness was afforded on one occasion, when the proprietor of a leading hotel in Rome at the last moment broke his contract. Failure was a thing not to be contemplated, so Cook grappled with the emergency by hiring for the use of his party the palace of Prince Torlonia for the immense sum of five hundred pounds for a week. During all the early years his work was a labour of love; or, if a profit was made, it was devoted to charitable or philanthropic objects, the great organiser relying for his livelihood upon the printing business which for many years he continued to carry on at Leicester.

If we wish to obtain something like an adequate notion of the wonderful scope of the gigantic concern which has been evolved from the tiny germ first planted by the 'pioneer of modern travel,' it will be well to glance over the programme of some of Cook's globe-trotting expeditions of to-day. Of quite a number which have started from our shores during the past autumn, half-a-dozen there are which at once arrest attention. Each and all are what are designated as 'Round the World Tours,' four of them east-bound—that is, wending outwards by the eastern and returning by the western hemisphere—and the remaining two in the opposite direction. All the chief points of interest in the four continents are to be visited, the lands of classical antiquity, those of the 'burning Orient,' China, and the 'awakening East,' with 'young Australia' and America. To meet the taste of those whose ideal is ocean-travel, one of the east-bound tours was announced as 'all sea,' there being not one yard of land-travel throughout a journey of more than twenty thousand miles; no need, if you wish not, ever to step ashore from the time that the port of London is left until it is again sighted some seven months later. Then, indeed, one must surely feel that one is in the hands

of 'Captain' Cook and emulating the first great circumnavigator.

At a first glance the cost of holidays such as these reads not a little startling. The cheapest of the six means four hundred and forty-six pounds five shillings per head; whilst for 'Party No. 2,' one of the east-bound trips, the membership of which is restricted to twelve persons, it reaches to six hundred and three pounds fifteen shillings each! Surely the most costly excursion ever heard of! is the conclusion which will, not unnaturally, be come to; and, indeed, it is for the moment calculated to stagger the imagination. Yet let it be subjected to but a little examination, and it turns out, after all, to be one of the cheapest ever known or even dreamed of. To start with, the total distance by sea and by land is no less than thirty thousand miles, so that the cost actually works out to no more than *fivepence* per mile! Then, as the party, which started on the 13th November, is not due back until the 23rd of July next year, the holiday will extend over a period of two hundred and fifty-one days, so that the cost per day for each member will consequently amount to no more than two pounds eight shillings, which includes practically almost everything which is necessary or can be wished for. But few of the party, it is probable, could live at home for very much less. Let this be placed in comparison with the cost of a trip from Liverpool to New York in one of the luxurious steamers of the Cunard Line. For such a journey, occupying only some five days, with not very much to be seen *en route*, the fares *en suite* for a single passenger range as high as four hundred pounds, or eighty pounds a day. Contrasted with this, it is impossible to deny that even the costliest of Cook's tours stands out most distinctly a marvel of cheapness.

Little doubt can there be that the secret of Cook's marvellous success lay in his extraordinary energy, an enthusiasm almost as of a Crusader, and accuracy of observation; above all, the sterling probity and conscientiousness which marked all his dealings, small as well as great. From his mind the desire of making or amassing money for money's sake was entirely absent, this, one may well believe, being a prime factor in the astonishing results he attained. When organising his trips to the 1851 Exhibition he lent a helping hand to poor people by the establishment of money-clubs in which the necessary funds could be accumulated. Again, if any member of his parties fell short of money he was always ready to become their banker without any charge. Ever, too, he had in mind the educative and humanising influence that travel must always possess, and was anxious to afford facilities for it to all. What a born leader he was stood fully revealed when as time went on tasks were entrusted to 'Cook's' which would have taxed the powers of great Government departments. When, in 1877, the Cabinet of Lord Beaconsfield was contemplating the acquisition of Cyprus, appeal was made to the famous firm for information regarding its resources, as being the most likely people to know. Again, when the Gordon relief-expedition was to be sent out, to 'Cook's' was confided the formidable task of the transport of an army of eighteen thousand men and all their impedimenta, with one hundred and thirty thousand tons of stores, to Korosko, on the Nile. Last, but not least, King Edward, when Prince of Wales, confided to Mr Cook all the arrangements for the Eastern tour of the young Princes. Whatever was to be done, none, it was recognised, could do better than he. Not until he had reached a ripe old age did he seek even a small modicum of rest, and then not until he had become almost entirely blind. Even when so afflicted, the veteran lost not a whit of his pluck and Christian cheerfulness, actually accomplishing a journey of eight thousand miles through Europe and Asia, in addition to one tour through the Highlands. When he passed away in the autumn of 1892 he left behind a name untarnished by a single stain, and one which is indissolubly bound up with the history of railway enterprise.

IS THE EARTH OLD OR YOUNG?

PART II.

WE may now inquire as to the answers pure geology has to give to our question, Is the earth old or young?

Once upon a time, as the children say, the materials that form our earth were all at a white heat. At a still more remote day—twenty thousand million years ago one great scientist asserts, although from more recent research it would appear that this value is somewhat too large—the world was a globe of molten matter; while at an even yet more distant day—say a million million years since—the earth and all that it inhabits was a swirling, seething mass of misty vapour.

We need, however, at this point only concern ourselves with the astronomical yesterday, a yesterday about one thousand million years distant, when over the dull red of the slowly cooling earth a mottled look was creeping, the tell-tale signal that round its outer rim a hard crust was in process of formation. During millions of years this rocky rind went on cooling and deepening. Now it cracked as a pane of glass does in a hard frost; now it bulged out here and deepened there; now its brittle rocks thrust up into a thousand fantastic shapes. During millions of years, we say, this foundational work went on.

As soon, however, as the earth sufficiently cooled

down to allow the vapour, hitherto floating high as great cloud-banks, to condense in the scraggy hollows, the denuding, dissolving power of the storm-tossed waters began. Gradually the fretting seas filled the ocean depths and lined the ocean shores with sand and the shallow pools with mud. In process of years the sand and mud hardened into rocks. Now and again the subterranean fires broke through the confining shell, overwhelming the newly formed rocks beneath a fierce lava flood, and at all times seas and land played a game of see-saw, now up, now down. Where tossing waters had been, dry land appears, only to be again submerged beneath the devouring sea. But the victory is only for a period, a geological age. Slowly the land again asserts itself and the sea recedes, only to gather renewed strength for the endless conflict. Once more it is sea, this time less deep perhaps; and then again it is land; and so the struggle goes on.

Thus age after age passed away, each period as it came and went setting its seal to its existence in the fossil plants and animals that found a lodgment in the water-formed rocks overlying the igneous core.

Still the same forces are at work around us, the sea encroaching here, the land rising there. Along many a seashore the waves break the rocks into pebbles, the pebbles into sand. By many a winding estuary and in many a shallow lake the laden rivers drop their burden of mud and sand. As it was in olden days, so is it now, and this rhythmic motion of sea and shore, the ebb and flow of ocean and continent, the alternating victory of sea and land, are the hours that mark the passing of geological time.

How shall we translate the moments of geological time into the years and centuries that chronicle the flight of historical epochs? Few facts impress the mind more regarding the immense abyss of time that measures any single geological age than the apparent impossibility of establishing such a comparison as is here sought. We know that the same forces which have operated since the first day of our earth as a habitable globe are operating still, still moulding the present circumstances of sea-coast, river-valley, and lake-bottom into the rough material of a new and future geological age; and yet, during the whole story of human history, it would seem that the physical features of the earth, even to its minutest details, have remained unchanged. We know that in some remote to-morrow the sand by our seashore, the ooze in our ocean depths, the mud of our continental lakes, will be transformed into terrestrial rocks, in whose stony matrix will lie hid the fossil records of our present civilisation; yet if one watched the forming hand of time for over a thousand years one would be constrained to say, 'The potter's hand is still.'

But we must have some foothold of comparison, however uncertain, between the present and the past, otherwise the figures which we have made use of at the beginning of this second article are impertinent guesses.

Let us take the present. Is it possible to arrive at any estimate regarding the rate at which mud or sand or ooze is being deposited in our seas or our lakes? It is evident that if we knew exactly the rate at which rocks, sand, clay, or shells were formed under water we should have a measuring-gauge to apply to the rocks that have been built up during the past ages of the earth's history.

Many judgments have been offered on this important factor in geological chronology. Of course the rate of deposit will depend upon a variety of circumstances; the soil of the country being denuded, the restlessness of the sea area, being some of the modifying conditions which have to be taken into account. If we, however, take an outside margin of one inch per century as the rate of rock-formation we have something to work upon, for now all we have to discover is the actual depth of stratified rock, and then we have in our possession the necessary data for a determination of the lowest possible duration of geological time.

Estimates as to the depth of stratified rocks vary from one hundred thousand feet to three hundred thousand feet. Let us take the smaller value as a minor limit, just as we have taken the multiplying factor of one inch per century as a minor limit, and we arrive at this definite result, that it would take twelve hundred thousand centuries, one hundred and twenty million years, at the very least, to build the present outer shell of stratified rock that surrounds our globe. At the very least! How much more distant than this the actual beginning of geological time is we cannot say, although we know from other evidence which will presently be brought forward that it could not exceed four times the value we have just given. Between these two dates, therefore, 120,000,000 B.C. and 500,000,000 B.C., the dawn of life on our earth lies.

Two lines of argument corroborative of the figures we have just given may fittingly be considered here. In the first portion of this article reference has been made to that important event in geological story, the glacial period. Now, it is possible to arrive at a rough estimate of the remoteness of that great ice age. In many parts of Caithness the boulder-clay lies a hundred feet deep; while here and there over this great deposit a layer of sand and pebbles may be found, this capped once more by a thin layer of clay. Over all is the surface black soil. No part of the boulder-clay has yet been transformed into rock, proof of its recent occurrence; but at its lowest depths it is hard and tenacious, evidence that the borderland between stiff clay and soft rock is rapidly being reached.

It would take at least one hundred and twenty thousand years for the ice-fields to fill the valleys to a depth of one hundred feet; and allowing another two hundred thousand years for the uplifting and lowering of the promontory of Caithness through an amplitude of three hundred feet, we

obtain 300,000 B.C. as the date of the ice age. Dr Croll, from astronomical considerations, places it somewhere about 200,000 B.C.

Now, if an occurrence so geologically recent as the ice age took place two hundred thousand years ago, we may reasonably assume that the preceding epochs—Primary, Secondary, and Tertiary—stretch over a period of time a thousandfold greater than this. Yet another subsidiary proof of the vastness of geological periods, if any such were needed, is found in the time many rivers must have taken to cut their way through the rocks or banks that hem them in. It is computed that Niagara has taken over thirty thousand years to carve its present course. Yet every inch of the wearing away has been done after the glacial age had withdrawn from North America. Then, again, in South Africa, the writer has examined waterways that are certainly fifty thousand years old, yet they are found in sand or clay of the most recent origin. All this goes to prove the immense age of our sedimentary rocks —that is, of our earth as a habitable world, for life is contemporaneous with the earliest sedimentary strata.

But the question is: Is the earth old or young? Well, it is at least a hundred million years of age, if that may be deemed old. Yet, as we have said, youth and age are relative terms, and perhaps in the lifetime of a world a hundred million years is simply a summer vacation, a mere fragment of its whole life-span. So the point to be answered is this: unless calamity, swift and unseen, descend upon our globe, how many years of life, of bountiful life, does geology say it may still enjoy? What, in the language of actuaries, is its present expectation of life?

Towards any revelation it may presume to give regarding the earth's future history, geology has to call to its aid its sister science of astronomy; and the portion of astronomical research which it seeks to avail itself of is that which deals with the decreasing internal heat of the earth and the consequent cooling and contracting of the earth's bulk.

Now, it is evident that, after all, the primal cause of the succession of geological ages lies in the movements of the earth's outer crust. It is true, winds and waves and waters are the formative agents in the upbuilding of stratified rocks; but they would be destroying agents unless the seas they floored, the estuaries they filled, rose in height and became dry land. It is the encroachment of sea upon shore, and the consequent uprising of dry land in some other quarter of the globe, which make rain and wind, rivers and floods, seas and currents, the beneficent forces they are.

Suppose, however, all movement of land and sea to cease, what is dry land remains dry land, what is sea remains sea. This is surely a much more abiding state of things, some one may urge. It is indeed an abiding state of things, the permanency, the quiescence of death; for consider what would take place in such a case. Slowly the sea would be filled up at the expense of the land, because slowly but surely the denuding forces of nature would wear down to a common level the inequalities of earth's outer shell; the waves would unceasingly fret away the sturdiest shore; the rivers would ever deepen their channels; wind and weather, storm and tempest, frost and fire, would level the highest hill, and bring down the pride of the loftiest mountain. Thus one day every vestige of land would disappear beneath the conquering sea.

Is such a doom possible? Not only possible but probable.

We will, I think, readily admit this if we recognise what it is that causes the great secular movements of sea and land. We have referred to the time, about one thousand million years ago—how this date is arrived at will be dealt with later—when the earth was at a red heat, and when over its outer surface a hard crust was forming. The earth must have been much bulkier then than it is now—how much bulkier need not concern us here.

Now, as the earth cooled it contracted, the outer shell crumpling up into those folds that now are represented in the great mountain ridges. We have also spoken of the bulging and the deepening and the see-saw rising and falling of land and sea as the cooling went slowly but steadily on. These pulsating movements are the outer indication of the life that lies hidden, the forces that are latent, in the earth's central fires. But in process of years the fires die down, the life grows less vigorous, the energy less potent, the contractions less pronounced. And the day must come when the fires will be quite cold, the energy all gone, and there will be only the repose and quiescence of death. Even if we admit that a part of the earth's heat be due to pressure and to the slipping and sliding of rocks, yet even then a day must come in time when the materials that go to make up the earth will settle into a position of stable equilibrium, and motion and heat as active forces will cease.

This, then, is the tale geology has to tell regarding the earth as a habitable world. Its morning, or rather the hour before the dawn, began a thousand million years ago in fierce, fervent heat, amid tossing seas and swaying continents, every hill a volcano, every valley a cauldron of fire. In two hundred million years hence the earth's heat will be all gone. The volcanoes will be extinct and earthquakes a memory only of more fortunate days. In a thousand million years death's defacing fingers will have brought every hill and valley, every mountain and plain, beneath a world-wide shoreless sea.

Looked at in this light, the earth is neither young nor old; but in the full vigour of a quiet, strong manhood, it stands midway between two extremes —the absence of all life through fervent heat and the death of all life through the dying down of the central fires.

We now approach the science that has the most definite information to give regarding the age of the earth. Astronomy has less hesitation than

either biology or geology in giving days and years, times and seasons, for the past and future calendar of our globe. 'Bring to me,' astronomy says, 'the necessary data for my calculations, and I will tell you when and how the earth sprang into being, and I will also open up to you the day and manner of its going.' The difficulty is, of course, to furnish the necessary data. Let us explain our parable by a definite example.

Round our shores twice every day the tides ebb and flow. Silently they rise, and as silently they fall. They are as relentless in their movements as time itself. At first sight it would seem that the tides have nothing whatever to do with the age of the earth; but no phenomena in sea or sky or shore have a more direct bearing on the past and future of our globe than just these silent-footed tides. The tides, as we know, move from east to west, while the earth rotates on its axis from west to east; that is, the tides may be regarded as a moving mass of water constantly pressing against the earth's rotation. But this unceasing opposition has the same effect on the earth's rotation that a brake has on a revolving wheel: it reduces the earth's velocity.

Now, this slowing down of the earth on its axis simply means that the day is gradually getting longer. The farther back we go in time, therefore, the more rapidly did the earth spin on its axis, and the shorter were the days, while if we look forward in time each day is slightly longer than its predecessor; through all the ages this constant diminution of rotational velocity, due to the friction of the tides, has been going on. We can, therefore, in imagination see a day in some infinitely remote past when the earth spun on its axis with incredible speed. And we may have in our minds also a time, infinitely distant, when the earth will so tardily revolve that it will be said scarcely to move at all.

Now, the amount of this tidal retardation is such an important factor in any research dealing with stellar evolution that many attempts have been made to determine its value. Mr Cowell of the Greenwich Observatory, from a very careful consideration of the records of ancient eclipses, has found that the lagging amounts to five-thousandths of a second in a century, or one hour in seventy-two million years. In 72,000,000 B.C., therefore, the day was one hour shorter, and in 72,000,000 A.D. it will be one hour longer than it is at present.

An important law of increase or decrease, however, has to be noticed here. If we go back in time seventy-two million years, the shrinkage in the duration of the day is one hour; if we went back twice as far, or one hundred and forty-four million years, the shrinkage would be a little more than two hours; while two hundred and sixteen million years ago it was a good deal over three hours, indeed almost four hours; that is, the rate of diminution increases more rapidly as we go back along the ages.

But the tides not only tend to reduce the earth's rotation, they also act as a drag on the moon's revolution round the earth. Now, for the moon to slow down in its orbit simply means that each month it is a little farther, and yet a little farther, from the earth. The difference is, astronomically speaking, very minute, only a few yards every sweep in its orbit; but a few yards, and a few yards, and a few yards grow to a good many miles in the course of millenniums. Thus in ages to come the moon will be an insignificant object in the midnight sky, while many millions of years ago it moved so near the earth as to graze its surface as it circled round our planet.

It must be insisted on that none of these statements are in the nature of guesses after truth. Years ago Sir George Darwin, from an exhaustive investigation of the action of certain dynamical laws, discovered that the moon moves round the earth in a spiral orbit. It has been left to our own time, as we have indicated, to place this theoretical deduction on the sure foothold of observed fact.

So, with theory and observation to help us, we are able to make this statement regarding the earth's past, that somewhat less than a thousand million years ago it revolved on its axis in about four hours, and that nearly in contact with it the moon circled with an almost equally incredible velocity.

It will be at once conceded that life would not be possible on a planet so situated as the earth was at that distant age; for, not to speak of the swift rotation, the fearsome tides, and the great overhanging moon, there was the heated surface to hinder existence. Indeed, we know that the earth did not cool down sufficiently to allow a hard crust to be formed upon its surface until its rate of speed upon its axis was not very different from what it is at present. For, if it were otherwise, the flattening at the poles and the bulging at the equator, which set in *after* the earth cooled, would have been much greater than it is at present.

Thoughts like these would fix a time about four hundred million years ago as the date when the outer shell of the earth was cool enough to allow life, such as we know it, to exist. This is the limit which the astronomical theory of the tides places to the date of the dawn of life upon our globe. It might be later than four hundred million years; it could not be earlier.

And as regards the future, in what direction do the tides carry us? Through untold ages the earth's rotation will slow down, and slow down, till at last its energy is all wasted in fighting the finally mastering tides. How far off that day is we cannot tell; neither may we offer judgment on the possibility of man living on a planet one hemisphere of which is always in the full blaze of day and the other with the chill of an eternal night upon it. There remains now but to consider the question of the sun's heat in relation to the earth's age, and here we are at once met with conclusions at variance with the deductions from geological research.

It was one of the mysteries of former centuries —that is, centuries earlier than the nineteenth— how the sun was able to retain its heat. It

apparently belonged to that class of moral benefactors who by giving are not impoverished. Yet the scientists of former days knew of no law in the physical world which would explain how a body could continue giving out heat and yet not grow cold. It was left to the great Helmholtz to show that if the sun contracted in bulk it would retain its heat for ages. But it is evident to any man that the sun could not have been contracting for all time; neither can it go on growing smaller and smaller till at last it performs the extraordinary feat of disappearing altogether. There must be a limit in both directions, and the limits given by those who have studied the problem are that the sun cannot be older than twenty million years, and that in ten million years hence contraction will cease and our bright, bountiful luminary will rapidly become a cold, dark star, like many of those that now circle, unseen yet not unchronicled, in the midnight sky.

But twenty million years are too short, the geologist says, for the slow evolution of sea and shore, of 'fishes, birds, reptiles, and four-footed things.' He demands ten times this area of time for the evolution of rocks and plants, of limestone caves and glacial ages.

It was when things were in this pass that radium was discovered, and at once scientists saw in the remarkable properties of this substance means of reconciling the conflicting conclusions of geology and astronomy. A thin layer of radium spread over the inner surface of the sun would account for any amount of heat for as many millions of years as we like to make use of. Thus our twenty million years' limit is extended indefinitely; and, of course, our years of grace in the other direction are equally prolonged. So that, as far as the heat of the sun is concerned, if we allow that any part of it is produced by radium, the earth may be as old and may live as long as our imaginations may warrant or our desires demand.

There are several other considerations besides those dealt with in the foregoing article which might be of service in helping us to arrive at a decision regarding the earth's age; but the three major lines of argument which we have followed—the biological, the geological, and the astronomical—are sufficient, I think, to warrant the conclusion that the years of our planet as a habitable world cannot be less than four million centuries.

This is the earth's life-span, its threescore years and ten. By reason of more strength this stretch of time might be increased a bundle of million years more. But, on the other hand, the earth might meet its doom sooner; nay, it might find it to-morrow!

For, as is the case with human beings, there is no end of catastrophes, accidents, plagues, sorrows, and even sins that may shorten or end the earth's existence. The wheat-crops may fail through lack of nitrates, the atmosphere may become used up, the water-supply may cease, the earth's vast bulk may be knocked into pieces by a dark star, its shores may be deluged by a celestial shower of poisonous vapour, or an internal convulsion may bring its days to an abrupt close. These and a hundred other vicissitudes lie along earth's path, and against them there is no assurance.

But if calamity swift and sure descend upon our earth to-morrow, then there might be said of it what is said of many of earth's sons: Died in the fullness of vigour and strength. For our earth is neither old nor feeble nor even weakening towards old age, but instead throbs with the vigour of an almost eternal youth.

To the question, therefore, Is the earth old or young? we answer: It is young, strong, beautiful, full of abounding opulent possibilities, and rich in its inexhaustible treasures of charm and variety and in its God-given bountiful beauty.

A TALE OF THE SEALS.

By Lady NAPIER of Magdala.

AWAY out in the Hebridean seas lies an island, long and low, with a sudden rounded promontory rising from the northern extremity—a bold, buttress-like promontory, with high cliffs riddled with caves, into which the seas rush with a hollow roar, ebbing again with moaning sighs. Many seals made their homes in these caves, and the rock-pigeons nested in thousands in the vaulted roofs and deep rifts in the rock, happy and undisturbed by man. The Isle of the Seals was the literal translation of the Gaelic name of the island, and the shape of the island itself, when seen from the sea, was rather like a huge seal lying on the waters, his round head raised.

Many tales of the seals were rife on the island, and the people spoke of them and of their doings in hushed tones over their peat-fires on winter nights—strange legends, wild superstitions. The rocks about the promontory, with their great, still pools, were shunned at nightfall; and wild cries were heard on moonlit nights issuing from the caves, said the people.

The minister—who, when he was able to cross from the mainland, officiated occasionally in the little tumble-down church on the island—fought resolutely against the superstition of the inhabitants. He was full of zeal, full of impatience with all that he could not understand, with all bygone times, doings, and ideas especially, and secretly rebelled against the enforced use of the

Gaelic tongue. His efforts were attended with small success. The *cailleachs* heard him in stony silence; the *bodachs* shook their heads and said, 'Well, well!' and thought to themselves that the minister was young and foolish, and what could the like of him know about things? The young men slouched away, their hands in their pockets; what did they care, one way or the other?

Wild and eerie was the island when the gales swept across it, sometimes sweeping the poor little stooks of half-ripe corn out to sea, tearing at the close thatch of the little black houses, shrieking wildly at their non-success in stripping them; for the people could thatch in those days, and the wildest gale that ever howled across the sea had no effect on the little beehive-houses, as the strangers who sometimes visited the island called them.

But few strangers came there. There was no 'sport' of any kind to attract, and the people were sullen and suspicious of the stranger. There would have been fine work for a painter; but the painter seems to follow the well-worn track, with the well-worn subjects which he paints to death, judging by the yearly picture-shows.

But fair to see in summer was the island. The golden seas washed its shores; the rich-red tangle waved in the tide. The crops were of an emerald green, the peat-bogs a purple-brown, with little pools like bits of turquoise here and there reflecting the sky. Myriad flowers bloomed on the hill, and the *cannach* was like a sheet of shimmering silver in the breeze. The scents of hill and sea were intoxicating as wine; and, in spite of the minister, the tender cadence of the Gaelic song rose and fell, as lads and lassies worked in the small fields, spread nets to dry along the shore, or baited lines. Music, except when linked to psalm or paraphrase, was anathema to the minister, and he taught that all other music and—needless to say—dancing were snares of the Evil One, never to be indulged in by his flock. He has much to answer for, in the humble opinion of the writer.

The seals were not of his opinion. They barked and plunged and lay out on the rocks, and none molested them as they gazed around with shining eyes. There were more than one piper on the island, and sometimes the pipes would be played in the boats, and the seals would follow the boats in ecstatic enjoyment of the strains.

It was a glorious day, such as we of the west know well. The sea was as glass; the sun poured his rays unbroken; the breath of the sea was strong and sweet and fresh. 'And it's good weather we will be having, Maggie Ruadh,' said an old fisherman to a fine young woman, her babe on her arm, a tin can in her hand, as she strode with swinging steps along the shore. 'It is that,' she replied. 'I will be getting bait for Angus from the Cambus Ban.' 'There will be many seals the day at the Cambus Ban,' said the old man. 'Ay,' said the woman, a broad smile disclosing her white teeth; 'but 'tis the best place for bait, and what would the seals do to the like of me?' and she flourished a broken shearing-hook in her strong brown hand. Old Rory muttered and walked away, humping his round back.

The woman walked on. She clasped her babe closer and looked into the small face with rapturous love. A soft, old tartan shawl enwrapped her treasure, a tiny ragged shirt its only other garment. '*Ghaol*,' she murmured, and the child opened her dark-blue eyes and smiled.

Down the steep track the mother walked with firm step. Cambus Ban lay smiling in the sunshine. The tide was far out—as far as it could go, thought Maggie Ruadh. The big hole must be uncovered, and likely there would be crabs, perhaps a lobster, in it. She looked about, and there was a beautiful safe corner among the bent-grass and sand under the shadow of a great rock, where she might lay her babe and keep her well in view from the shore.

The babe cooed; the strong air was making her drowsy. The mother laid her tenderly down, and soon she slept. Maggie drew the old shawl softly round the tiny face.

Now for the 'Mad Hole,' as it was called in Gaelic, the sea making strange noises in it when the tide was rising; and Maggie, with agile steps and skirts kilted high, strode across the slippery weed. She was just in time, she thought, for there was the long-drawn-out sigh of the tide on the turn, and the little, dull breeze ruffling the surface of the water.

She plunged her hook into the hole, tearing away the weed that hung over its mouth. A scrambling, scratching noise! Yes, there was a crab—perhaps two; but they were very far in—the tiresome creatures!—and the tide was rising fast. She peered and groped, and peered again. She could just touch the crab.

A sudden barking noise made her withdraw her head from the hole. A huge seal lay within a few feet of her. His glassy eyes were fixed on her. A shudder ran through her. All the tales she had heard as to the malignity of the seals rushed into her mind. 'Mairi!' she exclaimed aloud. The seal plunged into the sea. The woman slipped and fell on the weed, but soon regained her feet. 'Oh, what was that?' She thought she saw something moving near the place where she had left her child; but the sun was in her eyes, and she could not be sure. Fearing she knew not what, she left her crabs and hurried to her babe. There was the little tartan bundle safe and sound, and from out it came strange wails. Clasping it to her breast and hushing it to sleep again, the woman breathed freely, and began to think regretfully of her crabs. She decided that she would say nothing about them to Angus; but, filling her can with bait, she walked slowly home, little Mairi sleeping soundly.

As sometimes happens in those parts, the beautiful day was followed by many days of storm and rain, and few ventured far beyond their houses. At length it cleared again. The sun shone; the

air was warm and balmy, with a clearness like crystal. Maggie Ruadh and her babe emerged from the darkness and peat-smoke of their little home, once more bound for the shore and in search of bait and shellfish. The woman sat down for a few minutes before descending the track. The strong light was almost blinding. She withdrew the shawl from the baby's head and smoothed the soft, downy hair. The child opened her eyes and stared at the mother. A shiver ran through the woman. 'Am I mad, or am I blind?' she thought. 'Mairi's eyes were blue, blue as the shadows on the hills on the mainland, and now they are black! Did any one ever see the like? What could it mean?' She wondered and thought; and then, like a wise woman, she decided that she would say nothing. It must be some freak of nature. She would try to find out if such a thing had ever happened to another woman's babe. No one would be likely to notice, Angus least of all, and the other women had enough to do with their own children, and would not have noticed if Mairi's eyes had been blue or green!

The little one grew and thrived, and the matter slipped from Maggie's mind in the fulfilment of the heavy tasks, the daily round of toil, indoors and out. Years rolled by. Brothers came to join Mairi. Maggie Ruadh was growing gaunt and weather-beaten. She was a good, hard-working woman. She spun, she wove, she knitted; she did her best to keep her man and her bairns in rude comfort, and to correct faults and shortcomings in the latter. But Mairi was too much for her, and at times a creeping sensation as of awe and terror would come over the woman when in answer to a slap and sharp word the child's eyes would blaze with fury, and she would gnash with her snow-white teeth. No tears ever fell from the bright black eyes. At other times Mairi would be soft and gentle enough; and when her father played the pipes, as he did now and again, regardless of the diatribes of the minister, a perfect ecstasy seemed to come over the child, and strange cries of delight would burst from her.

The shore, however, seemed to be her home. Nothing would keep her from the shore. In the stormiest weather she would spend hours roaming there. More than once she was cut off from the land, having wandered out to rocks that became islands at high-water, and there she would sit awaiting the ebb, her arms clasped round her knees, her black hair streaming in the wind, her little face white and set, gazing out to sea.

She developed into a handsome maiden as time went on, and would-be lovers were not lacking. She would have none of them, and rejected their advances with such bitter scorn that savage anger burned in the breast of more than one youth whom she had dismissed with stinging, cruel words. The sea seemed to be her lover.

Angus was growing old. He would fain have seen her married. Was not young Donald Gallach a fine lad, and was he not part-owner of the *Mary Jane* herring-smack, forby his own croft and good house? What could the girl want? And stormy scenes took place, and Maggie Ruadh wrung her hands as she saw the white teeth flash, the dull fire kindle in the wicked black eyes.

Mairi spent more and more time on the shore. The *cailleachs* shook their heads; the young men began to sneer when they saw her flitting about by the light of the moon.

Despair filled her mother's heart at length. 'What can it be that takes her to the shore at night?' she thought, and she determined to watch her opportunity and to follow Mairi. It would not be easy, but Maggie Ruadh's foot was as firm as ever. She bided her time.

The moon shone fitfully one night. A great halo was round it; clouds were hurrying across its face. Maggie Ruadh waked and watched. Husband and sons slept the sleep of the toiler.

The door was stealthily opened from within. Mairi slipped through, out into the moonlight. Maggie caught her breath. The time had come. She followed her. There was plenty of cover—peat-stacks and rocks; she could keep the girl well in view. Mairi skimmed across the white sand of the Cambus Ban. Her mother followed at a distance. Here was the critical time; but the girl never turned her head, intent on her goal. She glided out to the rocks across the slippery weed, and there she sat, with her hands clasped round her knees, the moonlight pouring on her rapt face, her head thrown back, her black hair streaming. Maggie hid noiselessly behind a rock hard by, the noise of the sea covering any disturbance she may have made.

Mairi sat on, gazing out to sea. Then she flung her head back and opened her mouth. A wild cry full of passion, of longing unutterable, burst from her lips; it was like the voice of a lost song. It died away. Then she raised her head again and repeated the cry. Maggie could see the throb of her white throat in the moonlight.

An echoing cry floated in from across the sea—a cry of triumph, virile, passionate, yet unearthly. Something was crashing through the waves, tossing them aside with resistless power. It approached. A white face with wide black eyes, and with black hair, and strong white arms beating masterfully among the waves.

It was too much. The agonised mother darted from her hiding-place and seized her daughter's arm. 'Mairi! Mairi! Mairi *ghaol!* what are you doing, girl? What is that?'

Mairi gazed at her. The dull fire blazed in the black eyes; the white teeth gleamed. She shook herself clear of her mother's grasp without effort, threw her hands above her head, and, with a wild cry, leapt into the sea, straight into the strong white arms held out, which quickly enfolded her.

A ringing bark was all the sound thrown back on the night.

THE DEATH-BLOW TO A WORLD-EMPIRE.

THE present year is the centenary of an event which was once upon the lips of every Englishman. The 'capitulation of Baylen' was the birth-throe of Spanish independence and the death-blow to the wide-extended empire of Napoleon. It was the Marathon of western Europe, one of those occurrences more far-reaching in their consequences than the most decisive battles. It was more important than either Leipzig or Waterloo. They were natural, perhaps inevitable, results of Baylen; and but for Baylen neither could have been possible.

A well-equipped Napoleonic army of twenty-five thousand men, led by one of the Emperor's most trusted generals, had entered Andalusia, commissioned to impose the rule of Joseph Bonaparte upon the hostile population of southern Spain. It was one of those nondescript armies which at that time followed the imperial eagles—not composed of French only, but of conscripts from almost every region of continental Europe.

The famous city of Cordova and its great cathedral (formerly the most celebrated of Moslem mosques, and stored with the accumulated treasures of centuries) were sacked by the invaders. The booty was enormous, and in view of the determined hostility of the province it was thought prudent to place it in safety.

Encumbered with five hundred wagons laden with the plunder of Cordova, the army, in long-drawn-out column, reaching several miles from front to rear, wound its slow way along wretched mountain tracks, when the advanced guard unexpectedly found the way barred by a Spanish force strongly posted, and protected by precipitous cliffs and deep ravines. Repeated charges failed to clear the path; and in the hottest part of the engagement two Swiss regiments in the Napoleonic army fraternised with some compatriots in the Spanish service, and went over bodily to the enemy. Simultaneously the rear was attacked by a second Spanish force; and the invaders found themselves hopelessly trapped. The Spaniards, exasperated by the fate of Cordova, declared that they would give no quarter; and the Napoleonic general, fearing that further efforts would result in a general massacre of his troops, agreed to a capitulation. His apprehensions were not without foundation; for it was with great difficulty that the Spanish general restrained his soldiers from putting their prisoners to death.

An entire Napoleonic army was in this way, on 19th July 1808, wiped out. Joseph Bonaparte, terrified, fled from Madrid; and southern Spain was freed from the invaders.

These, however, were the smallest of the results of Baylen. The news of the capitulation raised all Spain as one man to resist the domination of Napoleon. It changed a provincial into a national effort, and made possible the successes of Wellington in that long Peninsular war which drained the resources of the Emperor, and left him as a man with one arm tied behind him to face the concourse of his Continental foes.

This is how Alison speaks of the 'capitulation of Baylen:' 'Language can convey to future ages no adequate idea of the impression which this extraordinary event produced in Europe. . . . A disaster such as France had rarely experienced since the battle of Pavia had overtaken their standards; twenty thousand men had surrendered; the imperial eagles had found in Andalusia the Caudine Forks. . . . Europe was electrified, the empire of Napoleon shaken to its foundations. . . . The account of this defeat reached Napoleon at Bordeaux, and he was so excited by the news that his attendant Ministers were greatly alarmed. "Is your Majesty ill?" said Maret. "No." "Has Austria declared war?" "Would to God that were all!"'

The Emperor's depression was justified by events. From that day forward his doom was sealed. Previous to Baylen he had fought with kings. Henceforth he had to contend with peoples; and the end was inevitable.

To the English people of to-day Baylen has one special interest. But for it the present King of Spain would, like his cousins of Orleans, be a private gentleman and an exile, and our English Princess Ena would not be Queen of Spain and 'mother of her kings to be.'

FOR A BIRTHDAY.

A HEALTH to you, my son!
Too young to understand
My love, who take your hand.
Your little life has won,
By its sweet, sunny years,
Sanctuary for my fears.
A health to you, my son!

God keep you brave and true!
May Time and masked Fate
Keep your young heart elate;
Bring good in all you do,
Stand firm at manhood's goal—
Body erect, and soul.
God keep you brave and true!

A health to you, my son!
Whose childish life holds mine,
Even as the bright red wine
From ripened grapes has run.
God grant me many a day
To live for you, and pray.
A health to you, my son!

THE PHANTOM DEERSTALKER.

A LEGEND OF GLENGARRY.

By Alex. Inkson M'Connochie.

SPECTRAL deerstalkers are extinct in these modern days. It is even rare to meet a Highlander who will admit that such ever existed, though it is well known from Gaelic literature, both prose and verse, that the belief in spectral hunts was at one time widely spread in the Highlands of Scotland. The sound of hunting was frequently *heard*, both at noon and at midnight, and 'the broken cry of deer mangled by throttling hounds' was familiar; but nothing was *seen*.

Some half-score of years ago I met in Glengarry an old stalker of eighty who was over-generous in his appreciation of my forest lore as well as of my practical knowledge of the red stag and his ways. So he came to unbosom himself to me, and to him I owe the story of the phantom deerstalker —a story originally told by his father, Alastair Mor; for it was he who had the peculiar experience which makes the tale so unusually interesting.

Alastair, then a mere lad, but already a stalker of promise, had been sent to the hill for venison for the castle, for in those days the laird often left the shooting of the stags to his men. On this particular occasion he returned both empty-handed and early; and so his old father, Rory, now too stiff for stalking, made no attempt to conceal his displeasure. Alastair was, however, not inclined to tell his father the real reason of his unexpected return, endeavouring to put him off with such excuses as that the deer were unapproachable, the wind was bad, the wind changed, and so forth; but the old man was not to be deceived, and the truth had to be told.

'Very well, father,' at last said Alastair, 'I will tell you all. I saw *him* and the hound to-day.'

Rory's face took on an ashen appearance as he gripped his stick more firmly, while in his eyes was that far-away look which hillmen often wear when they recall memories which they would fain leave undisturbed.

Muttering a Gaelic incantation, he addressed his son, 'Oh yes, Alastair, I know you are too keen to come home and the sun not yet behind Ben Aigan without good reason. Tell me all about what you did and what you saw.'

'As you know, father, I started early for the ground below the Spidean, and I was at Tom-na-brock, where we spy the lower corries, before the sun was above Ben Tigh, so I had to wait till the light was good enough for the glass. I made out five middling beasts slowly coming up from the river-side, and I waited till they joined a good stag lying on the east side of the big wood. They soon settled down, and then I commenced to crawl across the flats towards them.

'The wind was steady, and Ossian crawled alongside me; but when we got into dead ground and walked to the hillock where I intended to leave the dog, I found the deer gone. There they were careering through the rocks. Evidently they were chased by a dog, and soon appeared to be hard pressed, for they alternately bunched and scattered. As they neared the Raven's Rock I distinctly heard the long, wild howls of a staghound, and some shouting as of a hunter. Ossian sat on his haunches and shivered as my little parcel made for the pass. Their speed increased as the sounds of dog and man rose higher and higher, and one of the stags jumped clear over the Raven's Rock, falling to the bottom several hundred feet below.

'The whining of Ossian was terrible. As I lay I cursed the impudence of the poacher who had doubtless temporarily cleared our forest, for I had now little hope of seeing another beast the whole day. All of a sudden, however, I caught sight of a small herd far up Corrie Mealach, just below the sheep-pass at the top. I put on the glass, and sure enough there were at least thirty good stags, all quietly feeding as though perfectly unconscious of

 [*All Rights Reserved.*]

what had just happened lower down. I could not understand it.

'The day, as you know, was hot, and to reach them meant much climbing; but as it was little more than noon, they had to be stalked. Ossian was still shivering, and I am afraid I called him names which I learned later were quite undeserved. I spied the foot of the Raven's Rock for the dead body of the fallen stag, but nothing was to be seen. I thought that very strange, for we both know how unbroken is the ground there. Again and again I searched with the glass, but with no result.

'Then I set off for Corrie Mealach. I envied Ossian, who, now rather subdued yet keen for work, had a bath in every pool we passed. When at last we came in sight of the deer, some feeding, some lying, I decided to retrace my steps so far and come in on them sideways, just below Clach More, by Murdoch's Pool.

'The wind—what there was of it—was suitable. I lay full length at the pool, and quenched my thirst with the fine spring water. Just as I lowered my head for a second drink I saw reflected on the calm surface of the pool the hunter of the Craggan Gower, just as once I heard you describe him. He was walking slowly. In front was a brindled deerhound with a black snout. Man and dog seemed alike absorbed in something just ahead of them. I could not withdraw my gaze from the pool, though I shook with fear as Ossian had shivered earlier in the day. The man's outline was perfectly distinct. He wore a rather short, grayish-yellow kilt, with his hose far below his knees. His hair was black, and came to his shoulders in long tresses. He carried a musket with a long, thin barrel, and at his side a big hunting-knife like a short sword. I was much struck also with the size of his powder-horn.

'I could look no longer, so I rose from the pool. My eyes naturally sought the ridge not more than eighty yards above me; but there was nobody there. Ossian stood close beside me, pointing straight at the ridge, so I said, "At them, good dog!" Instead of obeying, he gave vent to a most dismal howl and shivered more than ever.

'I sat and watched for at least ten minutes, then moved to the other side of the ridge. But my deer were all startled, and ran helter-skelter over the near skyline for the southern slope of Spidean Mealach. My courage finally gave way, and Ossian and I ran down the hill in terror.'

Old Rory's face, as his son told him of the phantom deerstalker, showed a rare mixture of fear and excitement; and before he fully recounted to Alastair, for the first time, the origin of the forest spectre, he invoked the blessing of Heaven.

'It's now many years since Donald Breac went out for his wedding venison; he stalks for it yet. He had long courted Mary Ban of Glen Cosaidh; but it was not till after several fights with rivals that he was allowed to become engaged to the girl of his choice. The spinning-wheel had been busy and the loom had purled long in Glen Cosaidh; the cattle were marked and the sheep kept on the home hirsel all in readiness for removal as her dowry to Donald Breac's croft. For he was a man of no small local importance. He not only stalked for the chief, Alastair Ranaldson Macdonnell, but also played soft, sad music to soothe him to sleep after the day's hunt was over.

'Donald Breac's success in love was, however, the indirect cause of a tragedy which will never be forgotten in the glen. In a fair fight he had the misfortune to lay low one of his rivals, who never rose again. The Caillach Beag, the latter's mother, had an evil reputation in the district, and it was said that on hearing of her son's death she took the black crook from the chimney, and with it pointed to the north, and after passes and mutterings pronounced a great curse on Donald Breac: "May neither body nor soul ever rest in peace."

'Everything seemed to go well with the engaged couple, and all was in readiness for the ceremony and the feast of the morrow; only venison was wanted, and naturally the bridegroom would see to that himself.

'So he set out for the hill with his faithful Bran and Glengarry's favourite flintlock; nor were spare flints forgotten. He must be very sure that day. Yet he stalked in vain; not a stag was to be seen. Who had been over the ground before him? If only he could get at the low hound of a shepherd! He—Glengarry's stalker—not to be able to find venison for his own wedding! The idea was intolerable.

'Ah! surely, after all, he was not to be without blood that day of days, for a fine stag had just appeared. The stalk promised to be an easy one, and he had in his own mind already gralloched the beast. Soon he would be within range, the musket loaded, the flint a proper length, powder in the pan, just over the hillock, a slide down the green slope. The stag was a "royal," and a magnificent beast at that. How his smoking haunches would grace the tables at the wedding banquet! In his eagerness he spoke his thoughts aloud: "I will have that stag even though the devil and all the black spirits in the glen should say no; nothing can prevent me." The shot was fired, but the stag fell not; on the contrary, he trotted quietly over the brow and disappeared. That Donald Breac should miss such a chance seemed impossible, and yet there was the mark of the bullet on a stone which is to be seen to this day. I myself, then a stripling, lay near to Donald Breac, and I trembled at what followed. The ravens frightened me not; but high on the wind rose a croaking laugh, and a human-like voice spoke, "Follow on, follow on, for ever and for ever." Donald Breac stood up, his face haggard, fumbling for powder-horn and bullets; slowly he loaded, and with a sigh and a weary look he followed the stag towards Craggan Gower. Far up the corrie the mist hung like a great curtain, which suddenly became a moving mass, loud

thunder seemingly issuing from its centre. As, driven by a great gust of wind, it moved rapidly towards us, I became afraid and fled downwards. Donald Breac ignored me, for he was walking as in a dream, his hound in front.

'Donald Breac was never seen in life again, and this is now the seventh time that his spectre has appeared. It is seldom visible without some dire calamity happening, though why an old witch should have any such power I cannot tell.

'Strange sounds were heard in Caillach Beag's sheil that night, and next morning no trace of her could be found. Lightning had probably struck her hut, for it was a ruin.'

DRIFTWOOD.

CHAPTER V.

SIR HUGO SOMERVILLE, eleventh baronet, *alias* Jones, man-servant and general factotum to Richard Cathcart, Esquire, stood at the window of the latter's sanctum at The Lodge, staring out moodily on the wilderness of tangled weeds in the walled garden beneath. His weak, handsome face wore its now habitual look of sullen despair and indecision, index of the restless thoughts within, eager to find a way of escape from the network of deceit in which he found himself involved, and yet afraid to look for it. He was on the horns of a dilemma, and either way Cathcart—he cursed under his breath—held the balance. Within a stone's-throw lay Thorpe Somerville, the inheritance he dared not claim, bound as he was by the paper Cathcart had forced him to sign, and by the fear that if he broke the conditions it imposed, the hungry horde of Jew money-lenders, no longer restrained by Cathcart's specious promises, would rush in and consign him to the terrors of that law which, so far, he had managed to elude. But what a freedom, and purchased with what a price! He had feared to risk the consequences of frank confession, and now found himself in a worse slavery than anything he had dreaded, with Cathcart as his jailer. What a fool he had been! What a fool!

He groaned aloud, and the sound roused him from his stupor of regret and stirred him to livelier self-pity. After all, what had he done? Spent more than he ought; but many men raised money on their prospects. There was little enough in that. If only he could have guessed all would be his so soon! If only he had not pledged his word to Cathcart! Was there no way out? A gleam of slow, painful comprehension spread over his not over-bright features, sodden by self-indulgence and the habit of surrender to a stronger will. Even to him remained two chances—two ways of life or death.

'It's the papers or myself!' he muttered as he turned with almost maniacal energy to Cathcart's desk.

For a long while nothing rewarded his search. Cathcart was not the man to leave anything about that might tell tales, and Hugo ransacked the drawers, hunted through flies and fishing-tackle, peered into sporting diaries, investigated the few papers he found—these chiefly of the unpaid-bill persuasion, but all equally valueless in the light of what he sought. He was ramming the last drawer home with something of an ill-tempered bang, when it thwarted him by refusing to shut. Obviously some rubbish had slipped down behind, and in thrusting in his hand to remove the obstruction, it fell upon, not the missing papers, but an old, worn pocket-book. He was about to throw it back into the drawer, wholly out of humour, when the lettering upon it, in gold, caught his eye. The crest, a greyhound *courant*, was that of the house he had dishonoured; the motto below, *Aut mors, aut vita decora*, was his own; while the letters of the intertwined monogram were the initials of his own and of his dead father's name.

Suddenly, in all its hideousness, a thought burst upon his bewildered brain. White and shivering, Hugo stood gazing at the book in his hand, heedless of the banging of a distant door, the sound of a footfall on the uncarpeted stairs. He was still standing motionless when the door opened and Cathcart entered the room.

With the snarl of a wild beast Hugo turned upon him, holding up the pocket-book. 'You scoundrel!' he cried, 'how did you come by this?'

A shade, so slight as to be almost imperceptible, passed over Cathcart's features. After so much had been achieved, it was, to say the least of it, annoying that his plans ran the risk of being thwarted by the vapourings of a meddlesome fool. Had the discovery been made by any one else, things might have gone very awkwardly for him. As it was, he knew his man—or thought he did. 'I think I ought to ask, "How do *you* come by it?"' he rejoined coolly. 'That's a pretty sort of thing to do to a man's private papers, isn't it?' jerking his hand in the direction of the rifled secretaire.

'Curse you! what do I care?' shouted the other fiercely. 'You murdered my father, and as I'm a living man, you shall swing for it!'

Cathcart could not help giving a hasty glance at the door, though outwardly he was calm as ever. 'Lucky Mrs Brown's deaf,' he remarked. 'After hearing you, she might be tempted to go in for melodrama.'

His gibe did but serve further to exasperate the other. 'Cathcart,' he said in the low, tense tones of a man labouring under terrible stress of feeling, 'I

swear that if you don't, for once in your life, give me a straight answer, you shall never leave this room alive.'

'Rather an abrupt ending to a singularly promising career,' observed Cathcart with complete unconcern. 'But, my dear chap, when have I ever given you anything but a straight answer—straighter, sometimes, even than you care for?'

'Stop that palaver!' Somerville said roughly. 'I want to know if you murdered my father.'

There was an instant's silence before Cathcart spoke. 'No,' he said at last with the utmost deliberation. 'I did not murder him, although the world would call it that. I killed him by mistake.'

With a snarl, Somerville half-sprang towards him; but, meeting Cathcart's eye, he fell back, cowed and almost calm.

'Get back!' the older man said in the tone men use in speaking to refractory dogs. 'Steady yourself if you can, and I'll tell you what happened.'

With an effort Somerville restrained the passion of hatred that almost overcame him. Undutiful son as he knew himself to have been, the cold-blooded confession awakened his long-dormant filial feelings, and filled him with an insatiable thirst for revenge.

Cathcart, accustomed to subservience from the poor shadow of a man who had been his creature for so long, paid small heed to the fire shining in the usually lustreless eyes. 'Yes,' he continued coolly, 'I shot Sir Hugh; but, as I told you, I had no intention of doing so. He came along in the dusk, walking exactly like—some one else, and I fired. That was my first mistake. The second seems to have been when I took that miserable pocket-book.'

Somerville was white to the lips. 'You meant to kill me,' he hissed rather than spoke, 'you incarnate devil!'

Cathcart's eyes contracted to pin-points. 'What if I did?' he asked. Then, dropping his voice as he held Somerville with a mesmeric glance, 'What if I do?'

Like some sinuous beast, he launched himself upon the younger man, who, however, was in some degree prepared for his onslaught. Seizing a heavy chair, he flung it towards his enemy; then, as Cathcart stumbled over it in the vain attempt to reach him, he dashed through the door, clattered down the stairs, through the dim hall, and out at the door, to seek shelter in the woods, anywhere, so only that Cathcart should not follow him.

This, although Somerville did not know it, was the last thing that was likely to happen; for Cathcart caught the edge of the table in his fall, and lay stunned. The old woman who 'did' for them had long gone; no one had heard the noise of the scuffle; and when he came to himself the shadows were stealing into the corners of the room. His head ached and throbbed intolerably as he drew himself to a sitting posture and tried to take in the situation. Look at it which way he would, he was in a very tight place; but he had been in tight places before, and had come out all right. The point that stood out most strongly at the present moment was that Somerville was gone, and with him the cause of his mad attack upon the wretched fellow. If only he had tried to get the pocket-book from him by craft! As it was, the game was up; for one man's word was as good as another's, and in that neighbourhood his own would have little or no chance against a Somerville's. Hugo was in the mood to blurt out everything, and that old fool Burton was already on the *qui vive*. No; there was nothing for it but to run, and to run at once. He was fairly hoist with his own petard, since, in attempting to scare Hugo Somerville out of his path, he had made the place too hot to hold him. He could see no way out of it, however. So, dragging himself to his feet, he made a careful toilet; rode his bicycle to the station, where he left it in the charge of the stationmaster pending his return on the following day; talked glibly of employing the best detectives from Scotland Yard to investigate the Thorpe Somerville tragedy; and took the night express to London.

In the meantime the man whom he had so grievously wronged was not in a state to reason calmly or to act wisely. Besides the desire to bring vengeance on his father's murderer, the thought of his sister engaged or married to a villain, such as he knew Cathcart to be, almost drove him out of his senses. So engrossed was he in his own miserable thoughts that a horseman came up unheard behind him in the dusk, and would have passed without seeing him had not the horse shied at the figure that the shadows of the trees rendered invisible to his rider.

'Hallo! What the'—— cried Harry Markham—for it was he—then broke off suddenly, the words frozen on his lips. What was there so familiar in the walk of that slouching figure that arrested his attention in spite of himself? Old Burton's story flashed across his mind, for this man answered in every particular to the description given: the heavy, fair moustache; the handsome, sullen, blue eyes; the weak, dissipated chin. If this were Hugo Somerville, he was Muriel's brother, and must be saved at any cost. With this thought foremost in his mind, Harry reined up sharply.

'I say, who are you?' he began, a feeling of pity overcoming his repulsion.

'My name's Jones,' was the sullen reply.

'But it wasn't that always?' Harry persisted.

'And what if it wasn't?' the other retorted. He cast his thoughts back over his past life, and wondered which of his many mistakes had arisen to confront him. Markham's voice broke in roughly upon his meditations.

'I suppose you have some object in hanging about here,' he said; 'but if you'll take my advice, you'll clear out as soon as you can. You've been recognised'—he lowered his voice—'and it might go hard with you if you couldn't give a good account of yourself.'

In a flash Markham's meaning burst upon poor Somerville, and the thought turned him sick and cold; for what account of himself could he give that would convince a child, with the pocket-book in his possession, backed by that doddering old fool's evidence of his identity?

'My God!' he gasped; and before Markham could raise a finger to stop him, he had darted across the road and was lost in the blessed obscurity of the woods. By cutting across country he might manage to catch the up-train at Raventree, and be free of this accursed place for good and all.

Every thought of Muriel's welfare had vanished; he was fighting for his own hand now—for his life against Cathcart's, who was never more dangerous than when desperate, as Hugo believed him to be. Already he saw himself branded as a parricide, and felt the rope about his neck. He ran blindly on, stumbling and tripping in the bracken, torn by briers, flying for his life.

At last the railway barred his farther progress, and he paused for breath, to hear the deep rumble of an approaching train. Was there time to cross, or must he lose the chance of catching the up-train at Raventree—the chance of safety? Anyway, it was worth the risk. Panting and breathless, he flung himself over the fence and made a dash for the line, slipped, stumbled, endeavoured frantically to recover his footing, and fell again. Two great eyes glared out of the darkness, and his last despairing cry was lost in the roar of the remorseless wheels!

CHAPTER VI.

THE untimely death of Sir Hugh Somerville, so quickly followed by the tragic end of his only son, provided a newspaper sensation for a day or two longer than common, owing to the elements of mystery and romance which surrounded the two events. Nor could the cloud be lifted even by those most anxious to do so, to whom the open verdict of 'Death by misadventure,' which was returned by the coroner's jury in both cases, could be less of a satisfaction and a solace than an ever-present uncertainty and source of disquiet. Sir Hugh had no enemies. Medical evidence supported the theory of his wound being self-inflicted, to which indications of a slip in the soft clay near the place where he was found by Markham and Burton gave still further support. The explanation satisfied the neighbourhood, which, although it had not forgotten the scandal of Sir Hugh's quarrel with his heir and Hugo's subsequent disappearance, yet knew nothing of the young man's recent reappearance in the rôle of Cathcart's servant. So far as they knew, Markham and Burton shared that information between them.

The remains of the worn and empty pocket-book found upon Hugo assisted in establishing his identity, which the evidence of Burton and other servants on the estate, who had known the young man from babyhood, was only required to confirm. That he should have been cut to pieces—probably on his way to ask his father's forgiveness—struck a poignant note in the tragedy, and called rather for sympathy than for suspicion. Amid the general mourning the absence of Cathcart was not remarked, save by the few who found a sinister meaning behind the fact. A letter was received from him resigning his tenancy of The Lodge, and notifying the reason as 'urgent private affairs,' which demanded his constant and unremitting attention elsewhere—a reason which, he deeply regretted, would occasion his unavoidable absence from the funeral obsequies of his late valued friend and neighbour. Beyond London, no address was given. In accordance with the instructions of Colonel Markham, who took the tragedy of his old friend's death seriously to heart, detectives ransacked the deserted Lodge from cellars to attics, but wholly without result. Signs of a quarrel were indeed visible in the broken lock of the rifled secretaire, the overturned chair, and disarranged furniture. When interrogated, the charwoman, Mrs Brown, knew nothing of any rupture between Cathcart and his supposed servant; and the inference remained that the two had decided to sink their differences, and had gone off together. Even Harry Markham was compelled to own that his hasty disappearance was the most damaging circumstance that could be urged against Cathcart. It was known that he had returned from London on the day of Sir Hugh's death by a train some hours earlier than the one by which he usually travelled; but this, in itself, was not evidence.

Moreover, the inexplicable mystery of Sir Hugh's pocket-book being found in the possession of his dead son held Harry silent, for at all costs Muriel must be spared. None who had seen her in her time of trouble would ever forget her and the pathos of her loneliness. Tall, fair, and pale, in her black gown, she had stood before them at the inquest, answering the coroner's questions with a simple dignity surprising to her hearers, who, until now, had only known and thought of her as a child. Harry Markham's heart bled as he watched her, taught by the intuition of a lover that her calmness was not that of endurance, but of a numbed brain and pent-up emotions, which must inevitably suffer a terrible reaction, all the more strenuous for having been so long controlled.

At last they showed her the stained pocket-book. She shivered, shook from head to foot like an aspen leaf, and turning to where Harry Markham was standing, cried, 'It is horrible—horrible! Take me away! Oh, take me away!' With a long, sobbing sigh, she fell back into Harry's outstretched arms; and he, lifting his beloved burden, carried her gently to her room, and left her to her women and kindly little Madge. Before night she was in a raging fever; and when that was at length sub-

dued, she lay for many days in a merciful stupor, oblivious of all that went on around her.

In the end youth and strength reasserted themselves, and Muriel struggled back to life and the sad knowledge of her bereavement. Perhaps, as she was the more able to think, the realisation of her utter aloneness retarded her progress towards health; for her strength came very slowly back, and the once active limbs were content to lie still for hours, while the poor brain wearied itself with hideous thoughts. Sometimes she felt too tired even to think, too tired to give harbourage to the memories which haunted most of her waking and many of her sleeping hours. Madge Markham and Miss Fancourt, the governess and friend of her childhood, who had hastened back at the first word of her sorrow, were unremitting in their efforts to draw the stricken girl back to something resembling her former light-hearted self. The doctors advised that, when possible, she should be roused and interested; and with this end in view, Madge one day induced Muriel to see Harry for the first time since the beginning of her illness. She was too shaken with the remembrances of those terrible days, recalled to her by his presence, to do more than put a frail, white hand into his and smile a pale little smile; and poor Harry came out of the room at the end of his long-looked-for five minutes with a lump in his throat and a mist before his eyes. Matters improved when the invalid began to take bath-chair exercise, and Harry, delighted to find a use for his strength, was permitted to be her companion and charioteer. Gradually she took up the thread of living: ate, slept, attended to business, even smiled sometimes, but always with that dreadful load of oppression at her heart.

'I think part of me died—you know when,' she told Miss Fancourt; and when that good woman tried to comfort her, she shook her bright head, with a grave little smile, and said no more.

One morning Harry came in and found her wrinkling her pretty brows over some paper the agent had sent for her signature.

'Are you strong enough yet for that sort of thing?' he asked anxiously.

'It doesn't hurt me, thank you,' replied Muriel; 'not half so much as doing nothing, or thinking all day long.'

'Try not to think, then, dear'—the caressing word slipped out very naturally. 'You know we all want you to get well.'

'Oh Harry!' the girl said pitifully, 'can't you help me? I think, and think, and think, and in the end my heart feels turned to stone!'

Harry came near and took the fragile hands in his firm, boyish clasp. 'Tell me what it is,' he besought. 'I want to help you. I think I only live in the hope that I may be able some day to do something for you.'

She was silent for a moment; but her hand remained in his, as if she found in the contact the assurance of comfort and help she so sorely craved. At last she murmured, 'The pocket-book, Harry! You know that it was father's, and that he always carried it. How—did—Hugo—come to have it?'

This time it was Markham who had nothing to say; but at last the imploring fingers wrung something out of him. 'I know. I've known all the time,' he said; 'but I can't explain it.' Fairness to the absent Cathcart tied his tongue; when he asked nothing better than to share his thoughts with her and return confidence for confidence.

'But you don't think'——

Feverishly she pressed him for reassurance; and, as in duty bound, he replied, 'Of course not; there's not a shadow of reason for thinking so.'

'I'm so glad,' she said. 'I've been so afraid—so dreadfully afraid; and now, if you think I needn't, you don't know what a weight will be taken off my heart. Dear Harry, it's all you.' Her soft eyes were brimming with innocent affection.

Poor Harry could bear it no longer, and rising, walked to the window, where he stood, watching the dead leaves chase each other over the hills and hollows of the park, until he felt he had himself in hand again. Then he came back to where Muriel was lying on the wide sofa, and sat down quietly near her. 'Did Madge tell you,' he began, 'that my leave will be up almost directly? The regiment is ordered to India, and I must join it at once.'

'Oh Harry, must you?' Muriel cried in distress. 'I expect you will love it. I should, if I were a man. But I shall miss you dreadfully.'

Harry swallowed hard. 'I hope you won't,' he said. 'I can't bear to think of anything troubling you, and yet I'm selfish enough to be glad if you do think of me while I'm away.'

'You may be sure I shall do that,' she told him. 'Every one has been kind, but no one has been so kind as you.'

The sweet voice broke, and Harry's own was not quite steady as he said softly, 'Will you come with me, dear? Come, and let me teach you to forget all this terrible business, and be your own happy self again. Will you?'

Muriel wrinkled her brows in perplexity. Harry was very odd to-day, she thought—not quite sure, even, that she liked him in this new mood.

'How could I, Harry? Men have all the best times, I think. Unless'—and she brightened—'unless Miss Fancourt came too!'

Harry bit his lip, though his heart sank at her words. 'But, you see,' he explained, 'I don't want to marry Miss Fancourt. I want to marry you.'

There was dead silence in the pretty room for a full minute. Then at last Muriel spoke, every word cutting her unfortunate listener like a knife. 'I couldn't, Harry! I couldn't, really!'

'Why not?' the young man persisted. 'You don't dislike me; at least, I don't think you do. I'd be very patient, and not ask for much. All I want is to take you away and make you happy—if I can.'

Muriel looked at him curiously. This was a

new Harry; and Harry in the light of a lover was a stranger offering gifts to her, who, alas! could give nothing in return. 'I can't,' she breathed; 'it wouldn't be fair. I do like you, Harry,' she went on, far too frankly for the young man's hopes, now rapidly disappearing; 'but'—and the blue eyes filled with tears—'I've nothing for you except that. And father always said I was to play fair.'

Poor Harry! He was very little more than a boy, and he felt as if his little world had stopped for good and all. 'I've been a brute,' he said ruefully. 'I ought never to have bothered you now. The best thing I can do is to take myself off, and let you forget if you can.'

Muriel could not speak; but she put out her hand and kept him when he would have left her, and he was still there when Madge and Miss Fancourt came in. Tea soon followed; and if Muriel was more silent than usual, her license as an invalid obviated the necessity for remark or excuse. Her good-bye was faintly spoken, but the hand she put into the young man's was allowed to rest there until he dared keep it no longer. He had failed, he told himself; but the failure had taught him something: that he need have no fear of Cathcart's memory, if his own obvious devotion had taken the young girl so completely by surprise; also—though how he knew it he could not say, 'plain soldier' as he was—that a woman is never lost until she is won.

(To be continued.)

THE OLD SCOTS ARMY.

THE idea of a territorial army is by no means new to Scotland. In fact, the scheme of service was far wider than that associated with Mr Haldane's name, and in its main features would have received the approval of Field-Marshal Earl Roberts. For proof it is not necessary to go back to the days of the old Celtic kings, when every man, lay or cleric—and it is even said the militant females of the various tribes—took part in both offensive and defensive war.

As everybody knows, the feudal system was introduced into Scotland early in the twelfth century, and in a short time became in theory—at least in the Lowlands—the basis of the whole land-rights of the country. The sovereign was the supreme lord and ultimate owner of the whole soil. To various persons, great and small, he granted estates, and they in turn made grants to others. In Scotland and in England, as on the Continent, the main return which the vassal had to give to his lord—be that lord the king or a subject-superior—was military service. A vital distinction, however, existed between the system as it worked on the Continent and as it worked in this island. William the Conqueror, knowing well the danger of powerful feudatories, imposed on the tenure which he set up in England this peculiarity—that the vassals of his vassals owed not merely service to their own proper lords, but also service to the king. And so in Scotland, when this new system had crossed the Border, the king could call upon all landowners, whether his direct tenants-in-chief or removed from him by some links of the feudal chain, to follow him to the field. This liability to service was not unlimited either in amount or nature, and its extent was frequently stated in exact terms in the charter by which the vassal held his lands.

But apart from this obligation of military service resulting from the tenure of land, and being really a matter of contract between the king and his grantees, there was early recognised a duty on all within the realm to do their best for its defence. This duty was threefold—namely, they had to serve, they had to arm themselves, and they had also to make themselves competent to use the arms which they bore. Owing to the destruction—by accident, by neglect, or by deliberate English malice—of the national records, it is difficult to point to definite written authority for these statements earlier than the reign of Robert Bruce. The national independence had been secured for the time at Bannockburn; but the English desire for revenge was strong, and English intrigues were ever on foot, both among disaffected Scots and as far afield as in Rome. Accordingly, while the Scots barons addressed to the Pope their historic letter of 6th April 1320, courteously and even reverently inviting his Holiness to confine his energies to the spiritual sphere, the more material aspects of the situation received the attention of the king in Parliament. No Act required to be passed imposing the duty of military service for the national defence. That obligation was taken for granted, and as attaching to all men between sixteen and sixty years of age. What was needed, in the king's judgment, was to secure that these levies should be properly armed and trained. Times had changed since the Battle of the Standard, when the Earl of Strathearn, scoffing at the mail-clad Normans, said that he would go farther than any of them into the enemy's ranks; and the War of Independence had taught the Scots that reckless courage was not the only thing that soldiers required. In 1318, accordingly, it was enacted that in time of war—that is, practically always, except during the infrequent episode of a formal truce—every lay person possessed of goods to the value of ten pounds should be bound to have for his body in the defence of the kingdom one sufficient aketon or tunic (probably padded and studded with small bits of iron), a bascinet or light

helmet, and iron gauntlets, with a spear and a sword; or, in place of the aketon and bascinet, a haubergeon or corslet and hat of iron. The penalty for disobedience was heavy and ingeniously contrived—namely, forfeiture of the offender's whole goods, one half to go to the king and the other half to the lord of the land on which he dwelt, thus for once enlisting on the side of law and order the sympathies of the local magnate. As for the unfortunate person whose worldly goods did not amount to ten pounds, but only to the value of a cow, he had to provide himself with either a good spear or a bow and a sheaf of twenty-four arrows. Quite as early as this there are also to be found provisions for securing the good behaviour of those joining the king's army and for preventing them from suffering in their absence by process of law, as well as for imposing penalties on those absent without leave.

It is difficult to say how far this enactment of King Robert was observed during the troubled reigns of his weak and incompetent successors. But with the advent of King James I. not merely was the old policy emphasised, but a new departure is to be noticed. Just as their experience of the peasants of the Transvaal is believed to have had its effect on those responsible for the efficiency of our present army, so his long captivity in England had impressed that young and energetic prince with the importance of the bow in warfare. Returning to Scotland in April 1424, he held a Parliament next month, at which two Acts were passed dealing with the national defence. Football had apparently taken hold of the people to the detriment of more useful exercises. So it was enacted that 'na man play at the fute ball under the paine of fiftie shillings'—the fine to go to the owner of the estate on which the culprit dwelt, or to the king's sheriff if the local landowner proved slack in its exaction. And this Act was followed by another providing 'that all men busk them to be archers fra they be twelve years of age,' and ordering that on every ten pounds' worth of land butts should be erected, near the parish kirk if possible, so that on holy days men might come and shoot and so 'have usage of archery.' For neglect the fine was a wether, to go as before to the lord of the land, or, failing him, to the vicecomes or sheriff. A few months afterwards was passed an Act conspicuous for its brevity even among the old Scots Acts: 'Item, it is ordanyt that in ilk sherifdom of the realm there be made wapynschawings [that is, armed parades of the whole fencible population] four tymes in the year.' Some difficulty apparently was found in the way of carrying out this enactment for want of the necessary weapons, and in 1425 it was accordingly followed by an Act ordaining all merchants engaged in foreign trade to import, in proportion to their other goods, 'harness and armoures, with speares-schaftes, bowes, and staves.' A little later detailed directions were issued for the conduct of the wapinschaws and as to the arms and armour of which the different classes were to be possessed. Four years later another Act prescribed additions to the equipment of the national levies, and specially that the non-archer should have a good sure hat for his head, a doublet of fence, with sword and buckler, and a good axe, or else a 'broggit staffe.'

The same policy was followed in the succeeding reign. In 1456 an Act ordering wapinschaws and prescribing the appropriate arms for each class also ordains 'that all manner of men betwixt sextie and sexteene be reddie on their best wyse to come to the Bordures and defend the land when onie wittering [news] cummis of the incumming of a greate English hoaste.' The flannelled fool and muddied oaf of these days had, however, as usual been shirking their duties, and next year it was solemnly enacted that 'the fute ball and golfe [which had now caught the popular fancy] be utterly cryed doun and not to be used.' This crying down was no mere empty denunciation, for all men dallying with these frivolities are to be punished with the baron's unlaw—here again an appeal to the pocket of the local magnate; and if he takes not the fine it goes to the king's officers. Every man, moreover, is to practise archery at the butts beside the parish kirk, 'under the paine to be raised upon them that cummis not at the least twa pennyes, to be given to them that cummis to the bowe-markis to drinke'—a sanction even more ingenious than the gift of fines to the baron, and likely to receive the hearty support of all thirsty and impecunious patriots. The same Act also prescribes that in the head-town of every shire there should be a bower and fledgear—that is, a maker of bows and arrows, hence the names Bower and Fletcher—and that the town should provide him with all necessary material. The very length of the spear also seems to have become standardised, and the importation and manufacture of spears save of six 'elnes,' exclusive of a 'clyst'—altered in 1481 to 'five ells below the bur'—was strictly forbidden.

The skill of the English archers had also become more awe-inspiring than ever, so that to the equipment of the ordinary man is added 'ane targe of leather to resist the schot of England;' but the frugal lieges are assured by Parliament that this will be of 'na coist but the value of a hyde.'

Towards the end of the reign of James III. troubles had arisen with Edward IV.—'the Revare Edward, calland him King of Ingland,' as the Scots Parliament rudely terms him; and not merely was a general levy ordered, but the whole seacoast was divided up into little commands, each six miles in length by one mile in breadth, so that if 'the saide Revare' should appear he would be met by the king 'with the hale body of the realme to leyf and dee with his hienes in his defence.'

Under James IV. the ordering of wapinschaws is repeated, as well as a prohibition of 'fut bawis, gouff, or uther sic unprofitable sportis,' so that men may rather pay attention to archery for the common

good and the defence of the realm. In spite, however, of all these attempts to make ready against the old and ever-vigilant enemy, Flodden Field had to be fought and lost in large measure through that skill in archery which the footballers and golfers had refused to acquire. Whether the miseries that followed that defeat would have taught the necessary lesson one cannot say, for the old conditions of warfare were passing with the introduction of firearms. The Scots Parliament, which had legislated about the spear and the gloves of iron, did not ignore the change. The preamble to an Act of 1535 quaintly proceeds: That because the shot of guns, hagbuts, hand-bows, and other small artillery now commonly used in all countries both by sea and land in their wars is 'sa felloun and uneschewable to the pith and hie curage of noble and vailzeant men, whose acts and deeds can not be shewn without contrar provision be had of instruments of war and battle.' On that account it was enacted that every landed man should, in proportion to his estates, acquire some of these newfangled weapons, hagbuts and culvereins, with powder, and pellocks and bullets of lead or iron, and have one or more men ready to use them and teach others to shoot the same. It is not surprising that the burden imposed by this statute was confined to men of landed substance. But it had nothing to do with their feudal position, and it applied not merely to laymen, but also to the clergy in respect of the temporalities of the Church.

The same Parliament, 'for the strengthening of the realm, and so that the use of arms be not abusit nor forgot in time of peace,' appointed two wapinschaws to be held yearly, on 15th June and 20th October. As before, merchants were also enjoined to import munitions of war in proportion to their cargo; only now it was powder and bullets and hagbuts, or metal for making them, instead of spears and bows, that were required. And from time to time this legislation is repeated down to the reign of Mary.

The period of service seems to have varied, sometimes being for as long as forty days, and for that time it would seem that men were bound to provide their own provisions. These by all accounts were of the most simple character, and were no doubt often augmented by the produce of a successful raid. Forty days, however, seems to have been the extreme limit, and more prolonged service had to be paid for. A spearman in a Border garrison in 1482, for instance, received two and sixpence a day, while the bowman's pay was two shillings. Even in those days army scandals existed, and in 1431 there had to be legislation for the punishment of men who had failed to serve against 'the rebels in the North,' although they had received pay for that purpose. After the introduction of artillery, its cost, including the wages of the Flemings and other foreign men of skill thought necessary for its proper use—amounting in 1474 to seven hundred and fifty-three pounds six shillings and fivepence—also fell upon the king. But otherwise the burden of national defence was not confined to him and his feudal vassals and their followers, but fell on every able-bodied man within the realm, in theory at least, according to his means and capacity. The system no doubt had its defects; but it preserved the independence of the country, and was not without its share in preventing the rise of a military caste. Perhaps it might even give some hints to our present rulers, for the wisdom of our ancestors is not always exceeded by our own.

THE VILLA MONASTERO.

By MARION YUILL.

IT was certainly an ideally beautiful place, and I was not at all astonished at my wife's enthusiasm over it. Being an American, Mamie's devotion to all things antique is a sort of cult, and this first visit to Italy had been an almost overwhelming revelation to her.

Although nominally a sculptor by profession, I possess an income which happily renders me independent of my exertions, and for the last two years my wife and I had been wandering all over the continent of Europe, pitching our tent wheresoever we listed, and enjoying our irresponsible vagabondage to the full. Of late, however, we had been staying in Rome, that great centre of attraction for all lovers of art in its purest form; and its mysterious magic had laid hold upon us so completely that we had decided on making it our home, at least until such time as our nomadic instincts should reassert themselves and compel us to move on.

With this object in view, therefore, we instantly set about looking for a house answering the indispensable conditions attaching to our romantic inclinations, and, to our infinite delight, we came upon the very thing we wanted almost at once. We had decided, first and foremost, that our new abode must be eminently picturesque, at least outwardly, for we were prepared to undertake the metamorphosis of even the most unprepossessing interior; secondly, it must be within easy distance of the city; thirdly, it must not be too expensive; and, lastly, and most important of all, it must possess a good garden and pleasant surroundings.

The agent to whom we first applied simply beamed when he heard what we wanted. He had, he assured us, on his books at that very moment a

villa a few miles from Rome, on the Alban Hills, which would in every respect answer our requirements. It was an old house—very old, dating indeed from the fourteenth century—and had at one time been used as a convent; but it had since then passed through many hands, and was but recently vacated by an Italian family of noble extraction who had migrated to Florence.

How we blessed that distinguished family for clearing out and leaving it free to us can be better imagined than described when I say that we both fell in love with the exquisite old place at first sight, and instantly resolved to annex it before we were many days older.

It was beautifully situated on the slope of a hill, and commanded a magnificent view of the plain of Rome, with a distant glimpse of the sea beyond. In form it was a long, low building, only two stories high, and still retained a quaint conventual air about it which appealed strongly to our artistic senses. It had been considerably modernised, of course, since it passed from the Jesuits' keeping; but there still remained several suggestive and fascinating little nooks and corners about the building that had evidently been the habitation of stone images or Madonnas.

The room which we decided upon for the drawing-room had once served as a refectory to the nuns; but its original aspect had been somewhat changed, and the shape and position of its windows altered. The tall, narrow, ecclesiastical-looking slits which had formerly but feebly illumined the room had long since been replaced by a generous substitution of plate glass, which reached, French fashion, almost from floor to ceiling, and admitted a free and abundant supply of fresh air and sunshine to the somewhat musty apartment.

From these windows one stepped directly on to a smooth gravel walk or terrace, beyond which a low wall, ornamented at intervals with stone vases holding flowers and overhung with long trails of banksia roses, divided this pleasant walk from the garden. A curious old fountain, green with age and surmounted by a hideous grinning satyr, occupied the centre of the terrace, and flung a cool, refreshing spray on the luxuriant vegetation around.

The very low rent demanded for the lease of this most desirable residence somewhat surprised us; but we prudently refrained from showing our inward exultation to the agent, who was evidently more than willing to come to terms with us. In order, therefore, not to appear too eager, we informed him that we should require a week or so in which to think the matter over; but, long before the stipulated time had expired, my wife, who had set her heart on possessing the villa, could bear the uncertainty no longer, and a bargain was at once concluded, to the satisfaction of all parties concerned.

The necessary repairs took some time to execute, as the rooms were very badly in want of repainting, and there was, of course, much consultation with upholsterers and decorators to be gone through before we could finally enter into possession; but towards the beginning of May things were so far advanced as to allow of our moving in with tolerable comfort.

The search for suitable furniture and the arranging of the same in the most advantageous position was a never-failing source of interest to us, for we were just like a couple of children over a new toy; but when at last the workmen had taken themselves off, and we rested from our labours and cast our eyes approvingly around, we mutually agreed that the result more than compensated us.

It certainly was a very harmonious and pleasing interior, and the living-rooms especially were simply charming. The drawing-room, with its long windows and highly polished floor, made an ideal summer habitation, but we felt a premonitory shiver in the region of our spinal column when we thought of what it would be in winter. However, its present aspect was all that could be desired, and we determined to take no thought for the future but enjoy our felicity while it lasted.

We were most fortunate in securing the services of an excellent English cook and housemaid, whose former employer had just died, and between them they managed to make us exceedingly comfortable.

I had set up a studio in a somewhat rude structure which I caused to be erected in a corner of the garden at a trifling cost, but it served my purpose admirably. There I spent my mornings, utterly absorbed in my work of modelling from life some peasant youth or maid whose natural grace of pose was in itself an inspiration, and well worth the modest recompense demanded in soldi.

It was a truly *dolce far niente* existence that we led in those days, and after our constant changing about from hotel to hotel we greatly appreciated our home-like surroundings. In the afternoons, when the heat was greatest, I abandoned all pretence of work, and spent the intervening hours between lunch and tea in company with my wife either in the garden or in the grateful coolness of our pretty drawing-room.

It was while resting thus one warm day in June that the strange adventure which I am about to relate befell me. Mamie had gone upstairs to lie down, as she was suffering from one of her frequent nervous headaches, and I had betaken myself to the drawing-room with a book and cigar, prepared to spend my usual lazy afternoon.

The cigar was excellent, but I cannot say the same for the book, which was excessively dull, and in a very short time I let it drop from my fingers to the floor, and leaned drowsily back in my chair. I lay for some time idly musing with half-shut eyes on things in general, and a piece of modelling in particular on which I was at that time engaged, until, lulled by the droning of the insects and soothed by my cigar, I at last fell sound asleep.

And as I slept I dreamed.

I thought that I was still in the drawing-room of our villa, but its aspect had completely changed. The long French windows had apparently shrunk to half their dimensions, and were now situated midway between the floor and roof and sunk deep in heavy stone embrasures. The sunshine, filtering from without through softly coloured glass, imparted a singular air of sanctity to the apartment, and made me feel, somehow, as though I were in church. The furniture which my wife and I had chosen with such scrupulous care had utterly disappeared, and except for a long, bare table and a few stiff-backed, uncompromising chairs ranged along the middle of the brick floor, the room was empty.

Did I say empty? Then I erred, for directly opposite where I lay in my lounging-chair, in a recess to the left of the window, with the light streaming full on her uncovered head, there sat a young woman.

What struck me most on first perceiving her was the singularity of her attire, which looked as though it belonged to a much earlier period than ours. Indeed, so strangely out of date and picturesque was her appearance that she might easily have stepped from the canvas of a Velasquez. Her gown, which was of crimson velvet, consisted of a long, pointed bodice and full skirt, the latter being looped gracefully over a white satin petticoat, from beneath the hem of which a tiny foot clad in a silk stocking and buckled shoe was just discernible. A triple chain of curious workmanship was suspended from shoulder to shoulder above the muslin chemisette over which the bodice laced, and was caught in the middle with a clasp of similar design. Her hair, which fell in rich profusion about her shoulders, was simply bound with a ribbon; and the full sleeves of her bodice, ending at the elbow, allowed the milky whiteness of her beautifully rounded arms full play against their dark background.

But the interest excited by these external details was quickly merged in the still stronger feeling of astonishment which succeeded as she suddenly raised her head, which had hitherto been bent thoughtfully downward, and turned towards me.

I have in my time seen many lovely women of all types and nationalities, but never in all my experience have I looked upon a face to compare for a moment with hers. It was not merely the perfect classic contour of cheek and chin, nor the marvellous colouring of hair and eyes, but above and beyond all these there was about her such a fine air of distinction and high breeding as belongs only to the great ones of the earth. Yet the face was far from proud, and in her piteous eyes there was little else than anguish.

She was young, scarce more than a child, but I have never before nor since seen depicted on so youthful a countenance such a burden of sorrow and suffering. Even to look on such misery wrung my heart cruelly, for if ever a human being stood in need of sympathy it was that stricken girl. Her slender hands clasped and unclasped themselves spasmodically as she sat gazing intently towards me, and her half-parted lips lent a singular air of expectation to her, as though she awaited some unforeseen development.

For a space which seemed to me an eternity we remained in this position, gazing helplessly into each other's startled faces, until at last, meeting with no response to her mute appeal, she turned away once more, and passionately wrung her hands.

To sit by unmoved and see that gently nurtured girl convulsed with grief, and yet make no effort to console her, was more than I could endure, and again I made a violent attempt to throw off the stupefying lethargy which held me in my dream; but my limbs were as if weighted by lead, and my tongue seemed glued to my mouth. Again and again I tried to rise, but only to fall back inertly on the cushions like some helpless paralytic.

And then, as I lay gazing impotently at her averted head, an extraordinary thing occurred. Rising slowly to her feet, she once more turned her face full upon mine, stretched her clasped hands entreatingly towards me, as though in a final desperate appeal, and moving noiselessly backward to the wall between the windows, raised one hand beckoningly—and disappeared.

The sun was still pouring hotly through the windows when I awoke with a violent start, and Mary, our housemaid, was busily setting out the tea-things in the cosy corner.

'Where is she?' I said anxiously, rubbing my eyes incredulously as I glanced wonderingly around.

'The mistress, sir? She is just getting up, and will be downstairs directly,' was the smiling reply, as she calmly continued her occupation.

And then I knew for certain that I had been dreaming, and that my lovely companion in the Velasquez costume had returned once more to the limbo of imagination from whence she had for a brief moment emerged to tantalise me with her wondrous beauty.

'Yes,' I said some half-hour later, as I sat sipping tea beside my wife, 'the whole thing was so absolutely realistic that I can scarcely persuade myself even now that it was only a dream.'

'It certainly is very odd,' Mamie remarked musingly, 'that you should even be able to describe her dress, for as a rule, you know, dear, you are rather a blind bat where women are concerned, aren't you?'

'Yes, I own the impeachment. I am terribly unnoticing as a rule, but I can remember every single detail of that girl's dress as distinctly as though she stood before me now.'

'But seriously, Dick dear, don't you think that idea of the stained-glass windows is simply lovely?' Mamie said coaxingly; and I guessed at once what she was driving at.

'In plain English, what you are anxious to

suggest is nothing short of restoring the room to its original shape, eh?' and I pinched her cheek teasingly.

'It sounds so absolutely exquisite, Dick, as you describe it in your dream, and of course in winter it would be ten times warmer and more comfortable than these draughty French windows, which are really not at all in keeping with the architecture, as you yourself admitted only two days ago,' she went on persuasively.

'Well, well, we'll think over it, my dear, and perhaps in the autumn, if finances will permit'——

And so the matter ended for the time being; but one day not long after, happening to be near the agent's office in Rome, I looked in just for a few minutes to talk over a small matter of business, and in the course of conversation I mentioned my wife's suggestion as to the restoration of the windows in the drawing-room.

'But,' he said in astonishment, 'how did you know the room was such as you describe? I never showed you the old plans, did I?' and as he spoke he adjusted his spectacles and began hunting about among a lot of faded-looking papers in a cupboard near his desk, from which he at last succeeded in extracting a bulky roll of parchment tied with tape.

'Ah,' he said with satisfaction, 'here it is!' and he unfolded and laid before me on the table a yellow-looking sheet of paper covered with an elaborate sketch of an interior. 'The refectory, now your drawing-room, was formerly like this, which, as you will perceive, is precisely such as you have just described.'

I was thunder-struck, for, as he said, the plan corresponded even in the minutest detail with the room I had seen in my dream.

He noticed my emotion, and regarded me so curiously that I began to feel quite uncomfortable.

'And you never saw this plan before?' he said again incredulously.

'Never,' I replied firmly. 'In fact, I did not until now know of its existence.'

'And no one has told you the story of the Count's daughter?'

It was my turn to look astonished.

'The story of the Count's daughter!' I stammered. 'What story? I never knew there was any story connected with the villa.'

'*Straordinario!*' he murmured thoughtfully—'*straordinario!* I should have thought the old legend had been related to you long since by some of the country people in the neighbourhood, for the peasants, signore, are steeped in superstition, and the story of the Count's beautiful daughter is a prime favourite of theirs.'

I begged him to acquaint me with the facts of this mysterious tale, and he then briefly related the following strange anecdote.

It appears that once upon a time—as the orthodox fairy-tales begin—there lived on a vast property about ten miles out of Rome a powerful and haughty, but impoverished, nobleman who by reason of his harshness and severity to his dependants was more feared than loved. His family consisted of his wife (a delicate, timid woman, who from the beginning of their wedded life had meekly submitted to the tyrannous yoke imposed by her husband) and two lovely daughters aged respectively seventeen and eighteen.

The younger girl resembled her mother both in appearance and disposition, but the elder and more striking sister was possessed of a totally different temper, and could ill bring herself to tolerate her father's autocratic rule. Consequently the two were often in conflict; yet, strange to say, she was his favourite, and in her he had centred all his ambitious hopes. By a brilliant marriage with a wealthy suitor of his own choosing she was to restore the fallen fortunes of the family, and the Count, as soon as she attained to womanhood, set himself to the by no means easy task of selecting a suitable *parti*.

The man destined to fill the enviable rôle of son-in-law must, of course, be possessed of both pedigree and wealth, and this pleasing combination was quite as difficult to find in those days as it is in our own. And so it happened that while her father still hesitated over the respective merits of two possible suitors, his high-spirited daughter took the reins into her own hands and eloped one moonlight night with a third, who had certainly no pretensions to the second indispensable qualification, being as poor as a church mouse.

The Count's anger on discovering what had happened was proportionate to his disappointment, which is saying much, and for days afterwards he raged about the house like a madman, venting his fury on whoever had the misfortune to come in his way.

His terrified womenfolks kept closely to their rooms, not daring to emerge until the worst of the storm had blown over, and even then did not presume to so much as mention the delinquent's name. He appeared, however, to calm down after a while; but he swore a fierce oath inwardly to take a terrible revenge on the man who had dared to oppose his will.

The young couple were intensely happy for a time, it is said; but at the end of a year, just a month after the birth of their little daughter, the husband was mysteriously assassinated one dark night in a deserted thoroughfare in Rome, and his widow was left to face her destitute position as best she might. In her desperation she bethought her of her father, and, thinking to melt his heart, forced her way to his presence with her infant in her arms, and flung herself on his mercy.

She must have been in utter ignorance of the sinister rumours which had not hesitated to associate the Count's name with the dastardly murder of her young husband, else she would never have ventured to put herself in his power; but, having done so, she was as helpless as her innocent babe.

What actually took place was never clearly known; but, far from being moved by her tears and entreaties, he treated her with brutal harshness, and finally had her secretly conveyed to a convent in the outskirts of Rome, now known as the Villa Monastero.

'The same in which we now live?' I said interrogatively.

He merely nodded, and continued.

'In those days, signore, there were dark deeds perpetrated within monastic walls under the much-abused name of religion, and that *carte blanche* was given to the Jesuits by her inhuman parent there can be but little doubt. What terrible fate overtook the poor young widow and her helpless infant can be but dimly surmised, but certain it is that from the day the convent doors closed upon her she was never again seen alive.'

'Great heavens,' I exclaimed when he had ended his grim tale, 'what a very unpleasant story! But what on earth it has to do with my dream I am at a loss to conceive.'

'Merely this,' said the Italian with a slight shrug of his shoulders, 'that all this occurred four centuries ago, yet the lady of your dream wore the dress of that period, your description of her unusual beauty is remarkable, and the plan of the room tallies in every respect with the one before us on the table. The narrow windows and brick floor ceased to exist more than a century ago, and how you came to conjure them up in your sleep is indeed a mystery;' and again he shrugged his thin shoulders.

It certainly was an extraordinary coincidence, and I could see that he was rather sceptical as to my ignorance of the legend; but, as there was no better way of proving the truth of my assertion, I had to let the matter drop. Mamie and I, however, had many a talk about it in the days that followed, until some fresh subject of interest cropped up, and it was not until autumn that it was again brought forcibly before us by the arrival of the workmen who were going to carry out the work of restoration which we were firmly bent on accomplishing.

I had been lucky enough to secure the services of the architect who had been employed by the late occupant of the villa, and I found him a man after my own heart, and possessed of a distinctly artistic temperament. He was intensely interested in the job, and we spent many pleasant hours in discussing things before proceeding to action. Finally, it was agreed that the two windows as shown in the ancient plan should be replaced in exactly their former position, but should, in addition, be supplemented by a third situated midway between them in order to add to the lighting of the room, which would otherwise have suffered.

As it was likely to prove a rather tedious business, my wife and I thought it best to clear out for a few weeks, leaving the maids in charge of the premises; so we moved into the nearest hotel, from which we made daily excursions to the villa to see how matters were progressing; and it was on one of these visits that the climax to my story was reached.

The masons had already removed the wooden framework of the French windows preparatory to filling them partially up, and were engaged in piercing a hole in the middle of the wall to make room for the third. This was by no means an easy task, for the walls were of enormous depth, and Mamie and I were watching them interestedly from a distance, when all at once we heard one of them utter a loud exclamation of astonishment, and begin wildly gesticulating to his comrades.

'I think I'll run across and see what's up,' I remarked to my wife, as I got on my feet and began sauntering towards the little knot of workmen who were now clustered about the architect.

'All right, dear! I dare say it's nothing very particular. These Italians are so very excitable; but while you're gone I think I'll go round to the kitchen and try to hurry up tea. I'm dreadfully thirsty;' and, so saying, she picked up her parasol and strolled away in the opposite direction.

'Nothing gone wrong, I hope, Morotti,' I said casually as I joined the group in the drawing-room.

The architect's face was a trifle pale, and he looked somewhat disturbed as he motioned the men to stand back and make way for me.

'We have made a most curious discovery, Signore Trevelyan,' he began gravely, pointing to a large breach in the wall. 'We have unearthed what appears to be a secret hiding-place.'

The aperture to which he referred must have measured at least five feet nine in height by three in breadth, and it was proportionately deep, so that there was space sufficient to afford standing-room to a fully grown person.

'Whatever can it have been meant for?' I said uneasily, an unpleasant suspicion beginning to creep over me as I watched Signore Morotti carefully removing the loosened bricks which still blocked the lower half of the opening.

'Not much doubt as to that, I am afraid,' was his quiet rejoinder; and, stooping down, he picked up a human skull and silently held it towards me.

'Good heavens!' I exclaimed in horror, recoiling a step or two from the gruesome object, 'then you think'——

'That we have lighted on a tragedy, signore, and that before we proceed to investigate it further we ought to call in the assistance of the police, for there is abundant evidence here to justify their intervention;' and as he spoke he again stooped forward and drew forth a long strand of what, despite the dirt and discolouration of time, was evidently a woman's hair.

And so it was under the supervision of the law that the remainder of the ghastly relics were collected and ultimately pieced together to form the connecting links of a long chain of facts which were startling enough in themselves without the additional interest which they possessed for me;

for we unearthed not only bones sufficient to identify a woman's skeleton, but also the tiny skull and accusing robes of an infant.

That the foul deed which had immured them in a living tomb must have been perpetrated some centuries ago was manifest from the crumbling but still wonderfully well-preserved remains of the garments, obviously of sixteenth century design, which lay in a confused heap at the bottom of the fatal recess, and among which was found a triple row of beads of curious workmanship fastened in the centre with a clasp. I have these in a cabinet in our drawing-room still, for at my earnest entreaty the proprietor of the villa sold them to me for a very trifling equivalent on hearing of my dream.

'You have the best right to them, Signore Trevelyan,' he said in his courteous way; 'for had it not been for your singular vision the restoration would never have been undertaken, and the secret contained in the walls would never have come to light.'

I make no assertions, reader, and I ask no credence for my story; but, as the agent said, there were dark deeds perpetrated in those far-off days within convent walls, and in my own mind I have not a shadow of doubt as to the identity of the skeletons found in the masonry of the Villa Monastero.

My wife and I still spend a great part of the year on the Alban Hills, and I have passed many drowsy afternoons since then alone in our drawing-room; but the beautiful haunting lady in the velvet gown has never reappeared.

SAILORS' PETS.

By the Author of *Realities of Sea Life*, &c.

THE love of sailors for dumb animals is proverbial. Very few ships in the mercantile marine now go to sea without a pet of one sort or another, while in the Navy the crew's favourite is accorded something approaching official recognition. Many a dull forecastle has been made cheerful by the importation of a talkative and inquiring parrot. Dogs, again, are universal favourites; while goats and monkeys may always be sure of a happy home in Jack's quarters.

On vessels bound to Eastern ports the men have opportunities of purchasing all manner of pets, a privilege of which they are quick to avail themselves. In the Strait of Sunda, for instance, the Javanese boatmen do a thriving trade with passing vessels. The writer has seen a procession of canoes come alongside stocked with monkeys, squirrels, parrots, parakeets, and other birds of brilliant plumage. For a trifling sum the natives are ready to sell either a marmoset or a full-grown monkey; while such birds as Java sparrows and canaries are to be had for 'a mere song.' By the time a vessel clears the strait her long-boat is usually packed with cages containing an infinite variety of brightly coloured birds, while her forecastle generally affords shelter to at least one parrot.

After a residence of six months in a ship's forecastle a parrot will become fairly fluent. On board ship its language may cause a good deal of entertainment; but if at the end of the voyage it is introduced into the domestic circle on shore its owner is likely to be seriously embarrassed. Sailors, however, love all animals or birds that are mischievously inclined, and it is perhaps due to this fact that parrots—which seem to possess an extraordinary facility for acquiring a varied, if not overchoice, vocabulary—have always stood high in Jack's estimation. Occasionally one discovers a parrot capable of rising above its surroundings by avoiding that which is evil. A bird, however, that fails to identify itself with the real spirit of the forecastle is not altogether to Jack's liking. But parrots of this order are rare. The average bird seems ready enough to learn either good or bad language, and the sailor who was trying to sell his pet to an old lady was truthful as well as diplomatic in meeting her inquiry as to whether the bird knew any bad words by saying that it could soon be made to say anything she wished.

On some vessels captains will not allow the crew to keep a monkey. On one occasion, at all events, a monkey nearly caused the wreck of a good ship. Getting aft one day, he got into the captain's quarters, which at the moment happened to be unoccupied. Being interested in the working of the ship's chronometers, he attempted to make a critical examination of their mechanism. Finding it difficult to get at the inside of them, he secured a hair-brush and successfully commenced a general assault and battery. With the chronometers out of order, it was not surprising that the officers experienced a difficulty in finding their true course, and one night the ship ran on a reef. Happily she ultimately got off, but not without being seriously damaged. According to the captain's calculations, the reef ought to have been left miles to leeward! The chronometers, however, were not to be relied upon, and the ship had to make the best of her way to the nearest port by dead reckoning.

For pure unadulterated mischief-making a combination between a monkey and a parrot will take a good deal of beating. On board one ship known to the writer such a partnership existed. The first excursion of this couple into the realms of evil

consisted of plucking out the tail-feathers of all the chickens on board. Later on the cook barely succeeded in saving a kitten from being drowned in a large pan of boiling pea-soup which he had left unattended for a moment on the floor of the galley. The lid was off, and Jacko was striving his hardest to thrust puss into the cauldron, while Polly stood by aiding his efforts by pulling the cat's tail in the desired direction. Owing to her fluency, this same parrot often caused serious disturbance in the fore-part of the ship, where she shared quarters with the crew. 'Don't be greedy!' was a favourite expression when a man helped himself too generously at meal-times. On other occasions she would exclaim, 'What a beauty!' if a man related a more than usually 'tough yarn.' But her chief delight was to sing out in the stillness of the night, 'Ahoy! ahoy! Turn out, all hands!' with the result that on more than one occasion the watch below suddenly turned out only to find themselves the laughing-stock of those on deck. On the homeward voyage the ship had reached the English Channel, and one of the hands was up on the main-yard touching up a few bare patches with a pot of black paint. Beside him Jacko was perched, looking the picture of happy innocence. On deck, and just below the yard, stood, bare-headed, the chief mate, who had been nicknamed 'Carrots' on account of his red hair and whiskers. At the break of the poop Polly was perched with one eye closed, apparently indulging in a sun-bath. 'Stand from under, Carrots,' she suddenly shrieked, and instinctively the mate looked upwards, with the result that he received on his head a pound of black paint casually upset by the monkey. For a time the chief officer raged furiously, vowing vengeance on birds and animals generally, but more particularly on the two criminals concerned. But his condition was so painful and so mirth-provoking that he had to seek his cabin in order to repair damages before carrying out his threats, and this enabled the crew to smuggle the two culprits out of sight. When the ship reached dock three days later the mate still showed obvious signs of his recent 'accident,' despite the fact that he had taken nearly all the skin off his face in his violent efforts to rid it of its coating of paint.

The presence of a dog on board is always a source of pleasure to Jack, for in addition to its natural lovable qualities, it can be easily taught a number of amusing tricks, and so made to beguile a sailor's leisure hours. If, however, misfortune should overtake their pet, seamen take it very seriously to heart. The writer had painful evidence of this fact some years ago while in the Southern Ocean. It was blowing half a gale at the time, and the ship's dog—a fine large retriever—was on the forecastle-head. Suddenly a heavy sea broke on board over the weather bow, and swept everything movable off the forepart of the vessel. Some of the hands saw the dog carrried over the side, and in an instant they rushed aft, cast adrift the quarter-boat, and lowered it, while the captain hove the ship to. Away went the boat with a crew of six men, those on board the vessel expecting to see it swamped every moment. Now and again the dog could be seen on the crest of a big wave, striking out pluckily for the boat as it fought its way over the watery hills. In the bow a man stood ready to complete the work of rescue. As he leaned over the side and stretched out his hand to grasp the dog's collar the poor beast gave a sharp howl of pain and disappeared in the jaws of a shark! Slowly the boat made its way back to safety, and the ship once again sped on her course. The men, however, for a long time went silently about the decks, for the loss of the ship's favourite was keenly felt.

A curious story is told in the Navy of a dog and a man-of-war which at the time was lying at Spithead just about to sail on a three years' commission to the West Indies. The ship's boat had been sent ashore for the last time to bring off letters and despatches. As it was leaving the jetty a fine black retriever was noticed taking an early morning stroll. He was invited into the boat, and accepted the invitation promptly. The crew rowed back to the ship, the boat was hoisted up to the davits, and the dog jumped aboard. Half-an-hour later the ship was under way. Upon her arrival at Bermuda the captain received a letter from one of the officials of Portsmouth dockyard claiming the dog. There was, however, no chance of returning him at the time; so Sailor—for so he was christened by the men—remained on board and served throughout the commission. In some ways he proved himself to be a dog out of the common. He was essentially a 'lower deck' dog, and never became friendly with the patrons of the quarter-deck. A perpetual feud existed between himself and any dog belonging to an officer of the ship, and many a sanguinary encounter took place in consequence. When the men went ashore for leave of absence Sailor frequently accompanied them, and it is recorded with regret that at times he returned from these expeditions 'unfit for duty,' for in addition to a warlike spirit he had cultivated a taste for strong liquors. On one occasion he broke his leave. He remained away from the ship for some days, but eventually found his way back to the quay. His eagerness to report himself was made manifest by a succession of prolonged wails; but the day being Sunday, the crew were at the time assembled at prayers, listening to a discourse from their chaplain. Many a furtive glance was cast in the direction of Sailor as he sent forth howl after howl, and the chaplain saw by the fidgeting of the men that his words were losing their usual effect, so he wisely shortened the service. The officer on duty readily allowed a boat to be manned with the object of bringing the errant Sailor on board. On reaching the ship he came slowly up the gangway, looking dirty and disreputable, and rather shamefaced too. But the

crew petted and tended him more than ever, much, it is to be feared, to the detriment of his moral character. At all events, on the ship's return to England the dog was reluctantly handed back to his rightful owner. Before long, however, he was sent back to the ship, for his late master found that the dog was intensely unhappy apart from his old shipmates.

Another man-of-war had a goat at one time as a ship's pet, and the crew always took great pains to show him off to the best advantage. On Sundays he attended inspection parade with hoofs blackened and polished and a handsome red cloth collar round his neck. The only man on board with whom he was unfriendly was the chaplain. Apparently there was no reason for this antipathy, but it was noticeable that on the approach of the reverend gentleman Billy lowered his head and butted viciously. One day he 'outflanked' the chaplain, and attacked him with such dash and daring that the worthy man had, in consequence of the treatment meted out to him, to keep his cabin for some days. Billy naturally got into serious disgrace with the powers that be for this offence, and ultimately he was compelled to retire from the service on the ground—as Jack put it—that 'His Majesty had no longer any need of his services.' It is satisfactory to know, however, that Billy's friends had made ample provision for his future needs and comforts.

On yet another man-of-war a bear was carried for some time. While it remained young it was exceedingly playful and afforded infinite amusement to all on board. As it grew older, though, it showed signs of temper, and would occasionally scratch or viciously hug a member of the crew. Its popularity consequently waned, and one day, while balancing itself over a ventilating shaft, it fell—accidentally or otherwise was never known — and broke its back.

On board ship cats and dogs generally fraternise and live peaceable lives after a preliminary skirmish or two. In a certain ship trading to the East a fine Persian cat belonging to the captain had for a long time held undisputed sway over the affections of the crew. A new hand coming aboard, however, introduced an Irish terrier with a big reputation for courage, especially where cats were concerned. The meeting between the cat and the dog was awaited by the crew with a good deal of interest, although the admirers of puss had no forebodings as to the result of the encounter. As soon as the dog had gained his sea-legs he set about exploring the decks, and while prowling around he espied puss sitting at the foot of one of the gangways, apparently all-unconscious of impending danger. The dog halted suddenly, for he was not accustomed to see cats adopt an attitude of unconcern at his approach. But puss failed to move. As a matter of fact, she appeared to be intensely interested in an object immediately above the dog's head. After a while the terrier seemed to realise that his inactivity might be misconstrued, so without further ado he gave a preliminary warning bark and rushed forward. Puss, however, showed no anxiety. She only arched her back a little more and parted the corner of her lips, showing her fine white teeth. And then a strange thing happened, as the novelists say. The dog stopped short in his onward rush, barked once, but not aggressively, then turned tail and quietly walked away for'ard, *followed by the cat*. So puss won a great and bloodless victory, and in later days she and the dog became excellent friends, having many a sham fight, in which she generally had the best of matters.

White mice ere now have been trained to make sport with sailors, and a story is told of one that shared its owner's bunk and slept peacefully on his breast. At meal-times it was always in evidence, but at dinner one day it met an untimely fate. A large dish of pea-soup had been brought into the forecastle, when suddenly all hands were called out on deck to shorten sail. On the watch returning to their quarters they proceeded with their dinner, not noticing the absence of the mouse. Sad to relate, it was not until the dish had been nearly emptied of soup that they discovered the unlucky end of their little friend!

FROM THE 'PHARSALIA' OF LUCAN,

BOOK IX., TOWARDS END

(*circ.* 150 A.D.).

Assaracus,[1] where rose thy halls
Thick crowd the jungle trees;
Where columned temples reared their walls,
List to the moaning breeze!

The bramble clambers o'er the height
Where Troy sat throned of yore;
Lost to the ken her storied site—
Her ruins are no more!

Now rests the gaze on Hesion's[2] rocks;
Now, where the oak-trees tower
Beneath whose boughs Anchises once
Adorned his nuptial bower.

Lo, here the cave where Priam's son[3]
Adjudged the fateful prize;[4]
And there the golden Ganymede[5]
Was wafted to the skies.

Œnone[6] on that mountain brow
Roamed once in naiad glee;
Oh, here Tradition finds a tongue
In rock and stream and tree!

Translated by
Maj.-Gen. W. Tweedie, C.S.I.

[1] A king of Phrygia.
[2] Hesione, daughter of a Trojan king; exposed on a rock to a sea-monster, and rescued by Hercules.
[3] Paris. [4] The prize of beauty, to Venus.
[5] Son of Tros; carried off by Jupiter's eagle from Mount Ida to Olympus, to become cup-bearer to the gods, in place of Hebe.
[6] A Phrygian nymph—the beloved of Paris.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

A CONTEMPLATION of Turkey as as happy, enlightened, cultivated, and civilised a country as any in the east of Europe is pleasant enough in its way, and lovers of universal progress rejoice in the prospect that is submitted to them by some enthusiastic believers in the Young Turkey party and the reformed Sultan. But, whatever happens in Turkey, it is to be feared that English people are not quickly moved in their established views of foreign personages, and that they may not take so kindly to the new idea of the Sultan as some other people—as Germans—may. They have been too well accustomed in the past to associate some most uncomplimentary epithets with his name to permit themselves at the present moment to regard him as possessed of the best virtues. We remember that some few years ago we were attracted to the City Temple for one of the midday sermons when the late Dr Joseph Parker was preaching there. It was a time of great trouble and bloodshed in Macedonia, and it was generally expected that Parker would have something to say about it, as indeed he had. He was nothing if not a great actor, and a fearless one. He spoke of the horrible events that had occurred, and after emphasising the point that he stood in the pulpit as a minister of God, he dramatically—and using the strongest possible expression—called upon the Almighty to curse the ruler of the Turks. That was a fearful thing to say, and we doubt if any other than Parker could have said it in the pulpit. He knew his people. Now, with that remembrance, we turn to a remarkable article in one of the reviews, written by an ex-Turkish diplomat, A. Rustem Bey de Bilinski, formerly Turkish Chargé d'Affaires in Washington, who expresses the opinion that, being no longer able to sacrifice the country to his misguided ambition, the Sultan has suddenly awakened to a sense of patriotism, and wishes to make amends to his country by serving it in the only capacity left to him—that of a constitutional sovereign. He is to be as valuable to Turkey in the future as he has been injurious to her in the past. The writer mentioned is firmly convinced that, 'if only he lives long enough, Abd-ul-Hamid is destined to become the best sovereign Turkey has ever had, after having certainly been the worst. None better than he, possessed as he is of incomparable experience, a unique *coup d'œil*, a deftness of touch that makes a very magician of him, could pilot the ship of state through the stormy seas of reform. Who knows but what Abd-ul-Hamid may yet wipe out memory of the wrongs he has inflicted upon his country by services of at least equal magnitude!' And the feeling of British people generally, who do take a keen interest in this matter, is that it would at least be an ambition as difficult as worthy, and they trust, if adopted, it may succeed. Now, daily we are receiving new anecdotes of a kind, good, and most considerate Sultan. They are quite different from those we have been accustomed to hear, such as this, emanating some five years ago from a Greek ex-attaché in Turkey: 'Not only is the life of a man who is troublesome to him of little account, but spilled blood seems to calm and soothe his shattered nerves, always stretched to a snapping-point. "At night before going to sleep," says one of his chamberlains, "he has some one to read to him. His favourite books are those giving detailed accounts of assassinations and executions. The stories of crime excite him, and prevent him from sleeping; but as soon as his reader reaches a passage where punishment falls upon the criminal the Sultan immediately becomes calm and falls asleep."' But we must not believe all the bad things we hear of this potentate, especially those emanating from Greek sources, as so many of them have done in the past; and, after all, few people in the west of Europe have any means of authentic information about him. One thing that is beyond dispute is that he is a master of statecraft—one of the greatest masters in it of the monarchs of any time. He has a fine field of labour in the way of preliminary adminis-

[*All Rights Reserved.*]

trative reform. A little while since we were told some quaint stories of Turkish red tape by a gentleman who knew the country well and had spent most of his time there in recent years. One recent spring a pair of swallows had the courage to build their nest in the corner of a window of the regimental storehouse. The officer who was in command of the place knew not how to act in the matter, and was fearful of doing wrong. The offence on the part of the birds was not mentioned in his book of army rules and regulations, and so he considered it best to make a report of the occurrence, and send it to headquarters. There the report was considered during twelve months, and at the end of that period a reply was sent that the swallows were to be permitted to hatch their young, and that after that the nest was to be removed. But by that time the little swallows that were unhatched when the report was made were themselves happy parents. Some may say that a Government that has plenty of red tape cannot be wholly bad after all, and in such a reflection we may find hope for Turkey.

* * *

Railways on the level, railways underground, tramways, omnibuses, motor-cars, electric traction, aeroplanes: is it not a little curious to reflect upon the abnormally large share of general thought that is occupied at the present time by the various problems of locomotion? It would seem that it is a desire among men overwhelming all others to have the means of getting from place to place more quickly than ever before, and if possible more cheaply, though the cost is to some extent a secondary consideration. At one not very remote time the people of this country and others were largely indifferent in this matter; but with the virtual shrinkage of the space of the world there has come the desire that it shall be practically annihilated, and the pressing competition between nations and the increasing difficulties of life have necessarily quickened the desire. And it comes to pass that these problems of passage present themselves to us in many different ways; and, from being merely matters that seemed to concern financiers most and other people little, they are now more and more occupying the thoughts of 'the man in the street,' who is finding himself considerably affected by many things that are going on, and is likely to be more so by vast schemes which are projected. There is the great question of the railway combinations which are being formed, by which this man is told he will lose nothing, may even gain a little, and by which the people who invest their money in such enterprises may be enabled to earn a fair profit. The 'heavy' railways, as they are called in the City, do not fare so well in modern times as they once did, a circumstance which is attributable to various causes, few of which are to be regarded as of a transitory character. The state of things is now such that some of the big companies really carry their passengers at a loss, and would be unable to pay any dividend to their shareholders were it not that, besides conducting business as carriers of people, they are also engaged in subsidiary enterprises connected therewith from which they make enough money to show a profit on the general undertaking. Thus, it is pointed out that the Great Eastern Railway Company last year derived a sum of sixty-eight thousand seven hundred and eighty-six pounds from rent of arches and other properties, hotels, refreshment-rooms, bookstalls, &c., and the 1 per cent. per annum—½ per cent. for the half-year—paid on the Ordinary Stock of this company called for seventy-six thousand eight hundred and fourteen pounds, so that all but an odd eight thousand pounds was derived from the refreshment-rooms, bookstalls, and things of that kind. It is not to be expected that the big companies can continue this experience; hence the combines that have come and are coming. At the first glance, and with some faith in what the companies have been telling him about his convenience in the future, 'the man in the street' did not see that in these combinations there was any particular danger to himself; but now he is beginning to think a little more deeply on the matter than before. He feels that it is right and proper that shareholders in railway companies should be paid fair profits, and he may be willing to help them to do so; but he does not feel that the profits should be anything more than merely fair—meaning, in this case, very moderate—and he is beginning to put it to himself very pertinently that the railways, after all, exist mainly for the convenience of the public, and it is only a secondary consideration that they shall serve their proprietors excellently from the profit point of view. In other words, the railway is a semi-State enterprise. The State, the people, grant these companies unusual powers and privileges, they make for them Acts of Parliament whereby they are treated in the most favoured manner, and in return the companies are pledged to the most considerate service of the public, a service which in a large measure is well defined. If they fail in this service they fail in their bargain, made in all the most binding legal form, with the public, and it is already being debated how they may be called to account if this 'conspiracy' of the combines, as it has been called, should seriously and injuriously affect the travelling public, as appears not unlikely.

* * *

In London the problems of locomotion are peculiar and, in a manner, interesting. Life is quicker and more dangerous in the Metropolis than it has ever been before, and the public desire for the most part is that it shall be quicker still. Invention, financial enterprise, and manufacture cannot keep pace with the Londoner's desire for more speed, for the capacity to be in two places, if not exactly at the same time, in something so near

to it that the difference is negligible. For the consummation of this desire he is prepared to make many sacrifices, and has already made the great one of a safe and comparatively peaceful life in the streets. When we look back to the time, only some four or five years ago, when there were no motor-omnibuses, no taxicabs, and but few private motor-cars making their way along the main thoroughfares, the comparison between that time and the present —when it is positively dangerous for a country person unused to London to attempt to cross a busy thoroughfare without the guidance of a policeman —seems almost impossible; and it is difficult to realise that such changes should be possible in so short a time. But five years ago and you might have walked across the Strand at midday reading your paper, and now you need to linger on the kerb, reckon the chances of safety or danger, wait a while, seize some sudden opportunity, and, taking your life in your hands, make one wild dart across. If it is difficult to realise that this change has come about so quickly, it is almost equally difficult to believe that the people will continue to tolerate the strain, much less have it increased, which is the prevailing tendency. More motor-omnibuses, more taxicabs, are being called for, and they are being supplied, so that every day sees the dangers increase. And who is the better off for it all? Life for the passenger is little easier, and it is not pleasanter than it used to be. When he pauses to analyse his circumstances he has difficulty in convincing himself that he is altogether satisfied. And the proprietors of the vehicles are not better off. We find that one of these companies, a leading one, in the last financial year carried one hundred and ninety-six million passengers in London at a dead loss, each man on an average having three-halfpence spent on him and only paying a penny and a third. So in one way or another a change must be made, and it is likely that for many years we shall know no stability of system of locomotion. These things are of interest not only to Londoners, but to all other people who live in big cities and towns; for such problems as the capital is now confronted with may, and probably will, arise elsewhere in time, and the experience and conduct of London will be carefully examined then. Having lost the peace of life that was enjoyed when steam and horses were the only general propelling forces, it is not to be wondered at that some dreamy townsmen like to think of themselves as being at present not in any permanent state, but merely in one of petrolised purgatory, whence they will in due season emerge to a brighter, cleaner life than ever they had enjoyed before; that instead of going to their businesses and their pleasure through tunnels under the streets, they will some time fly to them through the air! Hopes in this direction brighten when they hear of two people flying in an aeroplane for more than fifty miles, flying for more than an hour! We are already farther forward with aeroplanes now than we were with motor-cars twenty years ago, and in that fact there is material for deep thought and conjecture. There is one phase of this subject in regard to which the man of whom we have been speaking finds himself in a very doubtful state of mind. Like most others, he hates war, and he feels that the modern policy of nations in increasing their armaments and burdening their people with such taxation that the breaking-strain has almost been arrived at is quite insane, and he is in a measure irritated when he finds that the development in the aeroplane is deriving practically its only stimulus from the war departments. The object of the nations at present is not to fly for the sake of convenience, pleasure, or economy, but in order the more effectually to destroy each other when the proper moment arrives. Solely for this reason are inventors being encouraged; they are rewarded when they succeed by the Governments acting on behalf of the war departments. We are getting the aeroplane through the war-spirit and no other. Of course, when we get it we shall in due course apply it to other and more peaceful ends than those of war; but it is a little singular, and to some minds painfully so, that our progress must come through this channel and no other, for we should be hearing nothing of aeroplanes now if it were not for this special encouragement.

* * *

One who lately came home from China, and while there had kept eyes wide open and mind keenly at work in examinations of cause and effect, and the possibilities of the future in that most interesting country, gave it to us as his conviction that the newspaper press of China was about to take a leading part in the modernisation of the people and in bringing them forward to Western ways. This is specially interesting, because hitherto we have not been able to consider the existence of any press in China. The empire has indeed enjoyed the possession of one newspaper which has some points of greatness in it, particularly in that it has been held to be the oldest newspaper in existence, and has apparently done its utmost to preserve the traditions of its infancy, which was in the period of some thousand years ago. Yet, with all their own experience and that which they have accumulated from their predecessors, those who conduct this journal have not in recent years shown any disposition to copy the methods of the half-penny papers of Fleet Street, or their prototypes in America and France; and yet their production is most absorbing, and we have heard it said that if such a thing could be printed in England, dealing with British affairs—which it could not—its success would be assured from the first number. Of course the *Pekin Gazette*—which is the translated name of this venerable sheet—is chiefly an official sheet, with the very smallest general circulation. The official notices of all kinds are printed in it, and

they are sometimes of a peculiarly personal and highly authoritative character. Thus there have frequently appeared in its columns the equivalent of what we call signed articles by the Emperor, signed articles by the Dowager Empress, by the leading Ministers, and others; and these exalted personages have used the paper as their means of communication between each other when, for reasons which are not obvious to our Western minds, they could not do so directly. The *Gazette* is published in three sections, one being the Court journal, which is compiled and edited by the members of the imperial family; the second is devoted to the promulgation of imperial decrees, and the third to the reports of Ministers and officials. We are informed that that wonderful woman Tze-hsi, the Dowager Empress, has herself written some scores of 'leading articles' for the first section, and it has been to her credit that most of them have been of a sensible character and in a sense worthy of a London morning paper. At times she has deplored the lazy habits of the young men of the country, and demanded that they should cultivate the military spirit and practise the bearing of arms. Then she has given her readers a detailed description of the way in which the Emperor passes his days, and at the same time has suggested improvements upon his Imperial Majesty's scheme of life. She has thrown out hints to Ministers and officials; and they, in the manner of a letter to the editor, have made reply in their own section of the paper. One time, some years ago, she expressed the opinion that the Emperor was not doing as well as he ought to do, and needed change; and in the next issue the official who took such matters under his wing announced that they had secured for him a cottage in the country, or the Chinese equivalent of such a thing. Again, she intimated that she had been paying attention to some irregularities of conduct and method among the officials in a certain province, and expressed the view that something ought to be done; whereupon in the next number the Governor gave reply that he had made all the necessary investigations, and had duly carried out a large number of executions. Now, here indeed is a newspaper in being, pulsating with the spirit of action from first page to last, making you feel that it stands not for words but deeds, and leaving no manner of doubt in your mind that it knows very well what it is talking about, and that if it does not nobody does. These are most admirable features in a newspaper, and so there is very much to be said for and to admire in the *Pekin Gazette*. But, alas! we are told on this authority that we mentioned that a great change is coming over Chinese journalism, that the *Gazette* is ceasing to be what it has been, that new journals are springing up in the provinces, and that somehow bacilli from Fleet Street seem to have found their way into editorial chambers. The new papers have some tendencies towards smartness, and our authority, with some wickedness, suggested that they might soon be expected to publish a sensational report of the assassination of all within the establishment of the Chinese legation in London.

* * *

If this relic of the ancient journalism should become lost to us, or should abandon completely its old traditions, as seems likely, we shall have little left in the world of newspapers that is not entirely modern, and increasing in modernism. Here in the capital the oldest Conservatives are complaining day by day that the staidest journals are displaying a dangerous tendency towards being up-to-date or smart, though we suspect that nearly always these complaints are born of a hypocritical affectation that is intended to suggest possession by the speakers of some peculiarly lofty ideal, the character of which is not to be defined by ordinary mortals. However, in such circumstances, is it not something of a blessing to think that we have still the *London Gazette* with us, and that if its much more ancient contemporary of Pekin is to abandon tradition, it at all events will remain steadfast to old principles and assume the position and honour of being the most antiquated journal in existence in all respects? At this very moment of depression about the news from China, we are reminded cheerily of the determination of our good *London Gazette* to go on in the old way, and, we infer, to hold faithfully to its established system of reporting news not before it happens, as is sometimes done in other quarters, but some months—and if need be years—afterwards. Thus what its readers miss in time they gain in a most matured authenticity; and if there are any of them—which, sad to say, we doubt—who stand by their journal and no other, they may still refuse to believe in anything that has been reported elsewhere until long afterwards. Was not the Boer war well on its way before the *Gazette* recognised it? And had not King Edward become well established on the throne and very busy with his beneficent peacemaking among nations before the *Gazette* chronicled his coronation a year afterwards? The modern newspaper registers itself at the General Post-Office as a newspaper on the eve of its first publication, and it is in this connection that we have at present to rejoice in the *Gazette*, for though it first appeared in 1665, under the title of *The Oxford Gazette*, at the time that the Court of Charles II. had been driven to Oxford by the plague, it is only now that it announces that 'this *Gazette* has now been registered at the General Post-Office as a newspaper.' This somewhat belated step was taken only on the publication of No. 28,185. They could hardly ever have done anything better than that in China, and there now appears to be no reason why the newspaper should any longer withhold from its readers the news of the landing on English shores of William the Conqueror, although it may not consider the present time opportune for any account of the Black Prince's operations in

France. And that reminds us that, after all, the *Gazette* was the first newspaper to attempt to cater for foreign folk as well as its own, though this is a tendency of some of our most modern journals. For some thirty years after its first publication it was printed in French as well as in English. Of course these remarks must be read in the knowledge generally possessed that the *Gazette* is a purely official publication after all.

* * *

The number of new books reminds one that the considerable world of authors, publishers, and readers, which is never without its grievances—mostly, it is to be admitted, real ones—has one or two of a serious character to contemplate in the present season, which the publishers are saying is a bad one from the business point of view. There cannot be any doubt that the production of copyright novels which only yesterday were the most popular of the season at sixpence, or well bound at a penny more, is proving a most serious menace to the interests of publishers and authors alike. There is seldom complete cohesion in this world of which we have spoken, interests being too frequently antagonistic, and so in this matter the public rejoices, as it saves money; but it does not reflect that if the present state of things continues the logical outcome is that publishers will not be able to produce new novels, since they could not afford to do so at sixpence or sevenpence, and that even if they could the authors could not afford to write them, since the royalties vouchsafed would necessarily be so meagre. New shilling reprints of copyright works other than fiction are threatening the book-makers in another quarter. Now, here is a pretty question: If the authors will not write new books to be published at sixpence or a shilling, and the publishers would not publish them anyhow, where is the future supply of these copyright reprints to come from? Kind public, think of this. But it is not roses all the way for the purchasers and readers of books. There are some thousands of them at the present time bewailing the iniquities of the present life and the hardness of their own lot in which they have been deceived. A certain history of the life of one famous statesman, written by another, is one of the best biographical works ever written by anybody dealing with anybody, and when it was issued three or four years ago thousands of people of humble means, who could rarely afford to spend anything at all in book-buying, made sacrifices and spent two guineas on this work. Soon afterwards, when the two-guinea public had been exhausted, the work was brought out at a much reduced price, and now it is again reduced, and is to be obtained unabridged for a paltry five shillings. But there is a worse case than this. A year ago a book of a century was published at three guineas, advertised extensively and expensively, and the public were brought to believe, what was the fact, that this was a work of most unique interest, which every man and woman should read and would be the poorer for not doing so. Again sacrifices were made, more so than ever. Poor people denied themselves necessities to buy these books, feeling that they would have a rich possession for ever afterwards, well worth the money they paid. Now, only a year later, a new edition of this book, in three volumes like the other, is being issued at six shillings! Purchasers and readers of the original edition in many cases have not yet read it through, and here they find, to their amazement and sorrow, that their property is thus depreciated in value. First editions of this kind of work have no special value in these days, since the number of copies issued in the first instance is so large. As a matter of fact, you may often buy such first editions, soiled, in Charing Cross Road for half-price or less. The question asked by the public in this matter is whether they are at all fairly dealt with. In times gone by it has been the practice, when an expensive book has been published, to keep up the price for some years, until, in fact, the book could be considered as in some measure an old one. Even now, when a book is thus issued at a high price, there is a kind of understood guarantee that that price will not be reduced until a reasonable period of time has passed and there is an entirely new public to cater for. The point of the matter is this: How many readers of these books would have bought them when they did had they known there were to be cheap reprints so soon afterwards? Not so many. Yet these are the people who guaranteed the success of the books. They may be more cautious in the future.

DRIFTWOOD.

CHAPTER VII.

TWO years from the date of the death of Sir Hugh Somerville, and that of Hugo, his only son, Muriel was on board a steamer running from Yokohama to Vancouver. Almost immediately after Harry Markham's departure to join his regiment, Miss Fancourt, with the full consent and concurrence of Colonel Markham—whom, by his will, Sir Hugh had appointed to be Muriel's sole guardian until she came of age—persuaded the heiress to close the house at Thorpe Somerville and travel for a year. The year had stretched itself out into an indefinite period, and was now nearing its second anniversary. By tacit agreement, Europe was left outside their plans and calculations. The

famous cities and sights were fraught with too much that was painful; so that, in the newness of her grief, to revisit them so soon would have seemed like sacrilege to Muriel. Anywhere else—so only that she might avoid the pangs of memory and leave, as far as was possible, thought behind her—she was willing to go; and a tour round the world suggested itself as the most hopeful means of securing a complete recovery for the shattered nerves and numbed faculties.

One bleak day in March a sad-faced young girl, wrapped in a heavy travelling-cloak, stood on the deck of the big liner *Kielder Castle*, watching the shores of her native land recede out of sight and ken. Now, after two years, Miss Fancourt was able to congratulate herself on the prospect of ultimate success. That good woman was herself no longer young, and to settle down to spend her small income and remaining years in doing quietly the good she could had been a dream from which she was loath to part. Yet she had never for one moment hesitated, never in her inmost heart complained; and now every day brought her reward appreciably nearer. The irreconcilable grief of the very young, the hopeless and unequal fighting against the mandates of a fate as cruel as it was inexorable, were gone, with happy childhood, for ever; but to Miss Fancourt's loving eyes her charge was daily ripening into a particularly charming woman. The shadow that still lingered in the violet eyes gave her an appearance of being older than her years; but she looked, and undoubtedly was, happy, taking a new and never-ceasing interest in the various aspects life wore in the countries through which they passed.

The winter season was spent at Simla, whither Harry Markham repaired as often as the authorities would permit him to do so. He and Muriel became fast friends; but beyond the lines of friendship Harry never ventured, and when the approach of the hot season necessitated a move being made by the two ladies, the establishment of a tolerably frequent correspondence was the only visible result of several months of pleasant intercourse. The next point was Japan; and although Muriel thoroughly appreciated the charms of that delightful country, it is not to be denied that she missed Harry as a companion and cicerone. And perhaps the girl was not entirely sorry when a letter reached Miss Fancourt from a brother long settled in Vancouver, inviting that lady and her charge to pay him a visit of some months' duration. The invitation was accepted, and Muriel sat bidding good-bye to Japan and its cherry-blossom with a great deal more regret than she had felt on leaving her native land. Yet she was beginning to admit that damp, misty England had charms of its own, and also that poor Thorpe Somerville had claims. In rather less than a year she would be twenty-one, and a person with responsibilities and duties; also, in just about a year Harry's long leave would again be due, and it would make a difference to her home-coming—exactly how much she did not bring herself to define—if he were there to welcome or be welcomed.

As she sat thinking, all at once she felt the uncanny sensation of some one watching her very intently, and looked up, half-expecting to see Miss Fancourt coming towards her. That lady, however, was not in sight, nor was any one near; but as she lifted her head, her eyes, drawn by some mesmeric attraction, fell on a sailor at a little distance who was engaged in cleaning some of the ship's brasses. He looked away immediately, and Muriel settled herself once more; but in less than five minutes the same thing happened again. This time she rose and walked towards a group of people who were just then coming on deck, first giving a searching glance at the man who had had so strange an influence over her. The impression she carried away with her was of lithe, sinuous grace, common enough in Lascar crews; yet this man was no Lascar—of that she felt perfectly convinced. As she joined in the laughter and gay chatter of some of the younger passengers the uncomfortable sensation faded; but in a few days it was recalled to Muriel's mind in rather a sinister manner by the young ship's doctor, who came to her preferring a singular request. It appeared that one of the crew, an Englishman, was down with fever; the attack was an exceptionally severe one, and there were grave doubts of the man's recovery.

'Practically,' said the young doctor, 'he is a dead man at this moment; but his mind is so alert, his faculties so acute, his will so strong, that they dominate the physical part of him. He won't die, he declares'—and the young man laughed nervously—'until he's seen *you*.'

'Seen me!' exclaimed Muriel in astonishment. 'What can he possibly want with me? He must be raving!'

'He has been,' the doctor admitted; 'but he's sane enough now. At all events, he's so weak that he's perfectly safe. He's a most curious chap,' he continued, almost as if he could not help himself. 'He's got a wonderful kind of mesmeric force, ill as he is. And he's what's called a gentleman—or was once.'

'He has mesmerised you, I think,' Muriel said, smiling. 'You have not yet told me what it is that he wants with me.'

'Well, to tell you the truth, I hardly know myself,' the young man responded. 'He asked me to be certain to tell you that you would repent it all your life if you did not spare him the few minutes he wishes for. He can't speak for any length of time, his weakness is too appalling. Any other man would have died twelve hours ago.'

Muriel gazed beyond the man at her side over the shining expanse of water, in which was reflected a sky of cloudless blue. Little ripples

chased each other over the calm surface, each flecked with gold in the dazzling sunlight. What a day to die! Suddenly she turned to the young man, deep compassion in her eyes. 'I must see him,' she said, 'even if it is only for the sake of a dying man's whim. It may be that I remind him, so far away, of some one at home.'

Without another word, the doctor rose and offered his hand to help her from her deck-chair. 'It must be at once, if it is to be at all, for more reasons than one,' he explained. 'I don't give him more than the day. I think you're an angel. I expect I shall be sacked for this,' he went on irrelevantly, 'the minute we touch land, if the skipper comes to hear of it.'

'I expect you will,' thought Muriel, smiling faintly, and then straightway alike forgot the boyish young doctor and her own nervous qualms; for as she entered the sick man's cabin the eyes that met hers, with a burning glance full of futile longing, chafing with impotence and desire, were those of the man whom she had known in another place as Richard Cathcart. She knew him at once—recognised him, moreover, as the sailor who had had so mesmeric an influence over her a few days before; and although the sight of him, weak and on the verge of dissolution as he undoubtedly was, brought a host of painful memories surging over her like a flood, she yet felt the marvellous compelling power of those strange eyes, and acknowledged to herself that indeed she had no choice but to be there.

'So you've come,' he said, his voice stronger than his evident weakness led her to expect. 'I wonder what made you.'

'I am sorry to see you so ill,' Muriel said, feeling somehow as if she meant it.

He moved his head with the old impatient gesture she remembered so well. 'I am dying,' he said; 'ought to have been dead by this, if only you'd have let me.'

'I!' said the girl in amazement. 'What can I have to do with it?'

Very dreadful it was to hear him try to laugh. 'Not much,' he cackled; 'but I expect I've got a conscience, or a bad pain somewhere, that makes me think so. Anyway, you and Sir Hugh between you almost made me feel a man again. You'll remember that. It was too late, though; and now I'm dying—pretty quick, too, so he says,' again with that curious upward jerk of the head. The effort exhausted him, and for some minutes he lay without speaking. When at last he revived, his story, which was a long one, fell from his lips in halting, if perfectly coherent, sentences.

He spoke of his first meeting with Hugo Somerville, then a mere lad, easily attracted by an older man with a good deal more knowledge of the world than he himself possessed. Gambling and racing led to the same fatal end, and before long Cathcart had introduced the young heir of Thorpe Somerville to Isaacs the Jew money-lender. Once in the toils, there was no escape. Hugo put his name to bill after bill, and his crowning folly was to sign his father's name to a cheque for a large amount. The cheque was never presented, and therefore not dishonoured; for Cathcart obtained immediate possession of it, and easily persuaded the unfortunate Hugo that it amounted to a forgery. Under the pressure put upon him from time to time, he consented to everything that Isaacs or his instrument Cathcart suggested. Having bled Hugo as far as possible, the pair of schemers arranged that Isaacs should finance Cathcart in order to enable him to lay siege to the heiress. Hugo in the meantime was kept in ignorance of their real intentions, yet compelled to furnish information when required, and to stand by in the guise of Cathcart's body-servant.

The whole plot was so cold-blooded, so audacious, that Muriel gasped as she listened. More than once the doctor looked across from his position behind the sick man to note the effect of his revelations. He need not have been alarmed. It seemed to Muriel as if that for which she had been waiting had at last arrived: here, at last, was the clue to the mystery she had so nearly broken her heart in trying to solve.

In spite of the terrorism of Cathcart's rule, Hugo sometimes broke away from his jailer, and it was on one of these occasions that he met his sister and frightened her by demanding her watch. Fortune certainly favoured Cathcart in the affair; but the young man had been recognised by the old collie Rory, and it was clear that no time was to be lost. Not that Cathcart had ever any intention of murdering Hugo: none of those instincts were his. His villainy was of that finer type which seeks, for base purposes, the mastery over men's minds, and recks little of their wretched bodies. Nevertheless, he wanted Hugo out of the way, and out of the way the miserable heir of the Somervilles had to go. Again fate played into Cathcart's hands. Chance brought him back from London earlier than he had intended on the day of Sir Hugh Somerville's death, and when, on his return to The Lodge, he found that Hugo was missing, he set out at once to look for him. Chance again led him to direct his steps towards the Fairy Pool, where, in the course of his search for the missing Hugo, he came upon the dead body of Sir Hugh Somerville. Evidently he had slipped on the soft edge of the pool, and as he fell his gun had gone off, killing him instantly. He was dead when Cathcart found him, but his body was still warm. It was in making this discovery that Cathcart's hands touched the pocket-book in the dead man's breast-pocket, which had proved his own undoing and the source of so much grief. He took it, partly on impulse, partly with the idea that it might contain something of use to him. As it happened, there was little of any value; and he burnt the papers immediately, but—perhaps with a view to further torture—omitted to burn the case itself, trusting

famous cities and sights were fraught with too much that was painful; so that, in the newness of her grief, to revisit them so soon would have seemed like sacrilege to Muriel. Anywhere else—so only that she might avoid the pangs of memory and leave, as far as was possible, thought behind her—she was willing to go; and a tour round the world suggested itself as the most hopeful means of securing a complete recovery for the shattered nerves and numbed faculties.

One bleak day in March a sad-faced young girl, wrapped in a heavy travelling-cloak, stood on the deck of the big liner *Kielder Castle*, watching the shores of her native land recede out of sight and ken. Now, after two years, Miss Fancourt was able to congratulate herself on the prospect of ultimate success. That good woman was herself no longer young, and to settle down to spend her small income and remaining years in doing quietly the good she could had been a dream from which she was loath to part. Yet she had never for one moment hesitated, never in her inmost heart complained; and now every day brought her reward appreciably nearer. The irreconcilable grief of the very young, the hopeless and unequal fighting against the mandates of a fate as cruel as it was inexorable, were gone, with happy childhood, for ever; but to Miss Fancourt's loving eyes her charge was daily ripening into a particularly charming woman. The shadow that still lingered in the violet eyes gave her an appearance of being older than her years; but she looked, and undoubtedly was, happy, taking a new and never-ceasing interest in the various aspects life wore in the countries through which they passed.

The winter season was spent at Simla, whither Harry Markham repaired as often as the authorities would permit him to do so. He and Muriel became fast friends; but beyond the lines of friendship Harry never ventured, and when the approach of the hot season necessitated a move being made by the two ladies, the establishment of a tolerably frequent correspondence was the only visible result of several months of pleasant intercourse. The next point was Japan; and although Muriel thoroughly appreciated the charms of that delightful country, it is not to be denied that she missed Harry as a companion and cicerone. And perhaps the girl was not entirely sorry when a letter reached Miss Fancourt from a brother long settled in Vancouver, inviting that lady and her charge to pay him a visit of some months' duration. The invitation was accepted, and Muriel sat bidding good-bye to Japan and its cherry-blossom with a great deal more regret than she had felt on leaving her native land. Yet she was beginning to admit that damp, misty England had charms of its own, and also that poor Thorpe Somerville had claims. In rather less than a year she would be twenty-one, and a person with responsibilities and duties; also, in just about a year Harry's long leave would again be due, and it would make a difference to her home-coming—exactly how much she did not bring herself to define—if he were there to welcome or be welcomed.

As she sat thinking, all at once she felt the uncanny sensation of some one watching her very intently, and looked up, half-expecting to see Miss Fancourt coming towards her. That lady, however, was not in sight, nor was any one near; but as she lifted her head, her eyes, drawn by some mesmeric attraction, fell on a sailor at a little distance who was engaged in cleaning some of the ship's brasses. He looked away immediately, and Muriel settled herself once more; but in less than five minutes the same thing happened again. This time she rose and walked towards a group of people who were just then coming on deck, first giving a searching glance at the man who had had so strange an influence over her. The impression she carried away with her was of lithe, sinuous grace, common enough in Lascar crews; yet this man was no Lascar—of that she felt perfectly convinced. As she joined in the laughter and gay chatter of some of the younger passengers the uncomfortable sensation faded; but in a few days it was recalled to Muriel's mind in rather a sinister manner by the young ship's doctor, who came to her preferring a singular request. It appeared that one of the crew, an Englishman, was down with fever; the attack was an exceptionally severe one, and there were grave doubts of the man's recovery.

'Practically,' said the young doctor, 'he is a dead man at this moment; but his mind is so alert, his faculties so acute, his will so strong, that they dominate the physical part of him. He won't die, he declares'—and the young man laughed nervously—'until he's seen *you*.'

'Seen me!' exclaimed Muriel in astonishment. 'What can he possibly want with me? He must be raving!'

'He has been,' the doctor admitted; 'but he's sane enough now. At all events, he's so weak that he's perfectly safe. He's a most curious chap,' he continued, almost as if he could not help himself. 'He's got a wonderful kind of mesmeric force, ill as he is. And he's what's called a gentleman—or was once.'

'He has mesmerised you, I think,' Muriel said, smiling. 'You have not yet told me what it is that he wants with me.'

'Well, to tell you the truth, I hardly know myself,' the young man responded. 'He asked me to be certain to tell you that you would repent it all your life if you did not spare him the few minutes he wishes for. He can't speak for any length of time, his weakness is too appalling. Any other man would have died twelve hours ago.'

Muriel gazed beyond the man at her side over the shining expanse of water, in which was reflected a sky of cloudless blue. Little ripples

chased each other over the calm surface, each flecked with gold in the dazzling sunlight. What a day to die! Suddenly she turned to the young man, deep compassion in her eyes. 'I must see him,' she said, 'even if it is only for the sake of a dying man's whim. It may be that I remind him, so far away, of some one at home.'

Without another word, the doctor rose and offered his hand to help her from her deck-chair. 'It must be at once, if it is to be at all, for more reasons than one,' he explained. 'I don't give him more than the day. I think you're an angel. I expect I shall be sacked for this,' he went on irrelevantly, 'the minute we touch land, if the skipper comes to hear of it.'

'I expect you will,' thought Muriel, smiling faintly, and then straightway alike forgot the boyish young doctor and her own nervous qualms; for as she entered the sick man's cabin the eyes that met hers, with a burning glance full of futile longing, chafing with impotence and desire, were those of the man whom she had known in another place as Richard Cathcart. She knew him at once—recognised him, moreover, as the sailor who had had so mesmeric an influence over her a few days before; and although the sight of him, weak and on the verge of dissolution as he undoubtedly was, brought a host of painful memories surging over her like a flood, she yet felt the marvellous compelling power of those strange eyes, and acknowledged to herself that indeed she had no choice but to be there.

'So you've come,' he said, his voice stronger than his evident weakness led her to expect. 'I wonder what made you.'

'I am sorry to see you so ill,' Muriel said, feeling somehow as if she meant it.

He moved his head with the old impatient gesture she remembered so well. 'I am dying,' he said; 'ought to have been dead by this, if only you'd have let me.'

'I!' said the girl in amazement. 'What can I have to do with it?'

Very dreadful it was to hear him try to laugh. 'Not much,' he cackled; 'but I expect I've got a conscience, or a bad pain somewhere, that makes me think so. Anyway, you and Sir Hugh between you almost made me feel a man again. You'll remember that. It was too late, though; and now I'm dying—pretty quick, too, so he says,' again with that curious upward jerk of the head. The effort exhausted him, and for some minutes he lay without speaking. When at last he revived, his story, which was a long one, fell from his lips in halting, if perfectly coherent, sentences.

He spoke of his first meeting with Hugo Somerville, then a mere lad, easily attracted by an older man with a good deal more knowledge of the world than he himself possessed. Gambling and racing led to the same fatal end, and before long Cathcart had introduced the young heir of Thorpe Somerville to Isaacs the Jew money-lender. Once in the toils, there was no escape. Hugo put his name to bill after bill, and his crowning folly was to sign his father's name to a cheque for a large amount. The cheque was never presented, and therefore not dishonoured; for Cathcart obtained immediate possession of it, and easily persuaded the unfortunate Hugo that it amounted to a forgery. Under the pressure put upon him from time to time, he consented to everything that Isaacs or his instrument Cathcart suggested. Having bled Hugo as far as possible, the pair of schemers arranged that Isaacs should finance Cathcart in order to enable him to lay siege to the heiress. Hugo in the meantime was kept in ignorance of their real intentions, yet compelled to furnish information when required, and to stand by in the guise of Cathcart's body-servant.

The whole plot was so cold-blooded, so audacious, that Muriel gasped as she listened. More than once the doctor looked across from his position behind the sick man to note the effect of his revelations. He need not have been alarmed. It seemed to Muriel as if that for which she had been waiting had at last arrived: here, at last, was the clue to the mystery she had so nearly broken her heart in trying to solve.

In spite of the terrorism of Cathcart's rule, Hugo sometimes broke away from his jailer, and it was on one of these occasions that he met his sister and frightened her by demanding her watch. Fortune certainly favoured Cathcart in the affair; but the young man had been recognised by the old collie Rory, and it was clear that no time was to be lost. Not that Cathcart had ever any intention of murdering Hugo: none of those instincts were his. His villainy was of that finer type which seeks, for base purposes, the mastery over men's minds, and recks little of their wretched bodies. Nevertheless, he wanted Hugo out of the way, and out of the way the miserable heir of the Somervilles had to go. Again fate played into Cathcart's hands. Chance brought him back from London earlier than he had intended on the day of Sir Hugh Somerville's death, and when, on his return to The Lodge, he found that Hugo was missing, he set out at once to look for him. Chance again led him to direct his steps towards the Fairy Pool, where, in the course of his search for the missing Hugo, he came upon the dead body of Sir Hugh Somerville. Evidently he had slipped on the soft edge of the pool, and as he fell his gun had gone off, killing him instantly. He was dead when Cathcart found him, but his body was still warm. It was in making this discovery that Cathcart's hands touched the pocket-book in the dead man's breast-pocket, which had proved his own undoing and the source of so much grief. He took it, partly on impulse, partly with the idea that it might contain something of use to him. As it happened, there was little of any value; and he burnt the papers immediately, but—perhaps with a view to further torture—omitted to burn the case itself, trusting

famous cities and sights were fraught with too much that was painful; so that, in the newness of her grief, to revisit them so soon would have seemed like sacrilege to Muriel. Anywhere else—so only that she might avoid the pangs of memory and leave, as far as was possible, thought behind her—she was willing to go; and a tour round the world suggested itself as the most hopeful means of securing a complete recovery for the shattered nerves and numbed faculties.

One bleak day in March a sad-faced young girl, wrapped in a heavy travelling-cloak, stood on the deck of the big liner *Kielder Castle*, watching the shores of her native land recede out of sight and ken. Now, after two years, Miss Fancourt was able to congratulate herself on the prospect of ultimate success. That good woman was herself no longer young, and to settle down to spend her small income and remaining years in doing quietly the good she could had been a dream from which she was loath to part. Yet she had never for one moment hesitated, never in her inmost heart complained; and now every day brought her reward appreciably nearer. Yet she had never for one moment hesitated, never in her inmost heart complained; and now every day brought her reward appreciably nearer. The irreconcilable grief of the very young, the hopeless and unequal fighting against the mandates of a fate as cruel as it was inexorable, were gone, with happy childhood, for ever; but to Miss Fancourt's loving eyes her charge was daily ripening into a particularly charming woman. The shadow that still lingered in the violet eyes gave her an appearance of being older than her years; but she looked, and undoubtedly was, happy, taking a new and never-ceasing interest in the various aspects life wore in the countries through which they passed.

The winter season was spent at Simla, whither Harry Markham repaired as often as the authorities would permit him to do so. He and Muriel became fast friends; but beyond the lines of friendship Harry never ventured, and when the approach of the hot season necessitated a move being made by the two ladies, the establishment of a tolerably frequent correspondence was the only visible result of several months of pleasant intercourse. The next point was Japan; and although Muriel thoroughly appreciated the charms of that delightful country, it is not to be denied that she missed Harry as a companion and cicerone. And perhaps the girl was not entirely sorry when a letter reached Miss Fancourt from a brother long settled in Vancouver, inviting that lady and her charge to pay him a visit of some months' duration. The invitation was accepted, and Muriel sat bidding good-bye to Japan and its cherry-blossom with a great deal more regret than she had felt on leaving her native land. Yet she was beginning to admit that damp, misty England had charms of its own, and also that poor Thorpe Somerville had claims. In rather less than a year she would be twenty-one, and a person with responsibilities and duties; also, in just about a year Harry's long leave would again be due, and it would make a difference to her home-coming—exactly how much she did not bring herself to define—if he were there to welcome or be welcomed.

As she sat thinking, all at once she felt the uncanny sensation of some one watching her very intently, and looked up, half-expecting to see Miss Fancourt coming towards her. That lady, however, was not in sight, nor was any one near; but as she lifted her head, her eyes, drawn by some mesmeric attraction, fell on a sailor at a little distance who was engaged in cleaning some of the ship's brasses. He looked away immediately, and Muriel settled herself once more; but in less than five minutes the same thing happened again. This time she rose and walked towards a group of people who were just then coming on deck, first giving a searching glance at the man who had had so strange an influence over her. The impression she carried away with her was of lithe, sinuous grace, common enough in Lascar crews; yet this man was no Lascar—of that she felt perfectly convinced. As she joined in the laughter and gay chatter of some of the younger passengers the uncomfortable sensation faded; but in a few days it was recalled to Muriel's mind in rather a sinister manner by the young ship's doctor, who came to her preferring a singular request. It appeared that one of the crew, an Englishman, was down with fever; the attack was an exceptionally severe one, and there were grave doubts of the man's recovery.

'Practically,' said the young doctor, 'he is a dead man at this moment; but his mind is so alert, his faculties so acute, his will so strong, that they dominate the physical part of him. He won't die, he declares'—and the young man laughed nervously—'until he's seen *you*.'

'Seen me!' exclaimed Muriel in astonishment. 'What can he possibly want with me? He must be raving!'

'He has been,' the doctor admitted; 'but he's sane enough now. At all events, he's so weak that he's perfectly safe. He's a most curious chap,' he continued, almost as if he could not help himself. 'He's got a wonderful kind of mesmeric force, ill as he is. And he's what's called a gentleman—or was once.'

'He has mesmerised you, I think,' Muriel said, smiling. 'You have not yet told me what it is that he wants with me.'

'Well, to tell you the truth, I hardly know myself,' the young man responded. 'He asked me to be certain to tell you that you would repent it all your life if you did not spare him the few minutes he wishes for. He can't speak for any length of time, his weakness is too appalling. Any other man would have died twelve hours ago.'

Muriel gazed beyond the man at her side over the shining expanse of water, in which was reflected a sky of cloudless blue. Little ripples

chased each other over the calm surface, each flecked with gold in the dazzling sunlight. What a day to die! Suddenly she turned to the young man, deep compassion in her eyes. 'I must see him,' she said, 'even if it is only for the sake of a dying man's whim. It may be that I remind him, so far away, of some one at home.'

Without another word, the doctor rose and offered his hand to help her from her deck-chair. 'It must be at once, if it is to be at all, for more reasons than one,' he explained. 'I don't give him more than the day. I think you're an angel. I expect I shall be sacked for this,' he went on irrelevantly, 'the minute we touch land, if the skipper comes to hear of it.'

'I expect you will,' thought Muriel, smiling faintly, and then straightway alike forgot the boyish young doctor and her own nervous qualms; for as she entered the sick man's cabin the eyes that met hers, with a burning glance full of futile longing, chafing with impotence and desire, were those of the man whom she had known in another place as Richard Cathcart. She knew him at once—recognised him, moreover, as the sailor who had had so mesmeric an influence over her a few days before; and although the sight of him, weak and on the verge of dissolution as he undoubtedly was, brought a host of painful memories surging over her like a flood, she yet felt the marvellous compelling power of those strange eyes, and acknowledged to herself that indeed she had no choice but to be there.

'So you've come,' he said, his voice stronger than his evident weakness led her to expect. 'I wonder what made you.'

'I am sorry to see you so ill,' Muriel said, feeling somehow as if she meant it.

He moved his head with the old impatient gesture she remembered so well. 'I am dying,' he said; 'ought to have been dead by this, if only you'd have let me.'

'I!' said the girl in amazement. 'What can I have to do with it?'

Very dreadful it was to hear him try to laugh. 'Not much,' he cackled; 'but I expect I've got a conscience, or a bad pain somewhere, that makes me think so. Anyway, you and Sir Hugh between you almost made me feel a man again. You'll remember that. It was too late, though; and now I'm dying—pretty quick, too, so he says,' again with that curious upward jerk of the head. The effort exhausted him, and for some minutes he lay without speaking. When at last he revived, his story, which was a long one, fell from his lips in halting, if perfectly coherent, sentences.

He spoke of his first meeting with Hugo Somerville, then a mere lad, easily attracted by an older man with a good deal more knowledge of the world than he himself possessed. Gambling and racing led to the same fatal end, and before long Cathcart had introduced the young heir of Thorpe Somerville to Isaacs the Jew money-lender. Once in the toils, there was no escape. Hugo put his name to bill after bill, and his crowning folly was to sign his father's name to a cheque for a large amount. The cheque was never presented, and therefore not dishonoured; for Cathcart obtained immediate possession of it, and easily persuaded the unfortunate Hugo that it amounted to a forgery. Under the pressure put upon him from time to time, he consented to everything that Isaacs or his instrument Cathcart suggested. Having bled Hugo as far as possible, the pair of schemers arranged that Isaacs should finance Cathcart in order to enable him to lay siege to the heiress. Hugo in the meantime was kept in ignorance of their real intentions, yet compelled to furnish information when required, and to stand by in the guise of Cathcart's body-servant.

The whole plot was so cold-blooded, so audacious, that Muriel gasped as she listened. More than once the doctor looked across from his position behind the sick man to note the effect of his revelations. He need not have been alarmed. It seemed to Muriel as if that for which she had been waiting had at last arrived: here, at last, was the clue to the mystery she had so nearly broken her heart in trying to solve.

In spite of the terrorism of Cathcart's rule, Hugo sometimes broke away from his jailer, and it was on one of these occasions that he met his sister and frightened her by demanding her watch. Fortune certainly favoured Cathcart in the affair; but the young man had been recognised by the old collie Rory, and it was clear that no time was to be lost. Not that Cathcart had ever any intention of murdering Hugo: none of those instincts were his. His villainy was of that finer type which seeks, for base purposes, the mastery over men's minds, and recks little of their wretched bodies. Nevertheless, he wanted Hugo out of the way, and out of the way the miserable heir of the Somervilles had to go. Again fate played into Cathcart's hands. Chance brought him back from London earlier than he had intended on the day of Sir Hugh Somerville's death, and when, on his return to The Lodge, he found that Hugo was missing, he set out at once to look for him. Chance again led him to direct his steps towards the Fairy Pool, where, in the course of his search for the missing Hugo, he came upon the dead body of Sir Hugh Somerville. Evidently he had slipped on the soft edge of the pool, and as he fell his gun had gone off, killing him instantly. He was dead when Cathcart found him, but his body was still warm. It was in making this discovery that Cathcart's hands touched the pocket-book in the dead man's breast-pocket, which had proved his own undoing and the source of so much grief. He took it, partly on impulse, partly with the idea that it might contain something of use to him. As it happened, there was little of any value; and he burnt the papers immediately, but—perhaps with a view to further torture—omitted to burn the case itself, trusting

famous cities and sights were fraught with too much that was painful; so that, in the newness of her grief, to revisit them so soon would have seemed like sacrilege to Muriel. Anywhere else—so only that she might avoid the pangs of memory and leave, as far as was possible, thought behind her—she was willing to go; and a tour round the world suggested itself as the most hopeful means of securing a complete recovery for the shattered nerves and numbed faculties.

One bleak day in March a sad-faced young girl, wrapped in a heavy travelling-cloak, stood on the deck of the big liner *Kielder Castle*, watching the shores of her native land recede out of sight and ken. Now, after two years, Miss Fancourt was able to congratulate herself on the prospect of ultimate success. That good woman was herself no longer young, and to settle down to spend her small income and remaining years in doing quietly the good she could had been a dream from which she was loath to part. Yet she had never for one moment hesitated, never in her inmost heart complained; and now every day brought her reward appreciably nearer. The irreconcilable grief of the very young, the hopeless and unequal fighting against the mandates of a fate as cruel as it was inexorable, were gone, with happy childhood, for ever; but to Miss Fancourt's loving eyes her charge was daily ripening into a particularly charming woman. The shadow that still lingered in the violet eyes gave her an appearance of being older than her years; but she looked, and undoubtedly was, happy, taking a new and never-ceasing interest in the various aspects life wore in the countries through which they passed.

The winter season was spent at Simla, whither Harry Markham repaired as often as the authorities would permit him to do so. He and Muriel became fast friends; but beyond the lines of friendship Harry never ventured, and when the approach of the hot season necessitated a move being made by the two ladies, the establishment of a tolerably frequent correspondence was the only visible result of several months of pleasant intercourse. The next point was Japan; and although Muriel thoroughly appreciated the charms of that delightful country, it is not to be denied that she missed Harry as a companion and cicerone. And perhaps the girl was not entirely sorry when a letter reached Miss Fancourt from a brother long settled in Vancouver, inviting that lady and her charge to pay him a visit of some months' duration. The invitation was accepted, and Muriel sat bidding good-bye to Japan and its cherry-blossom with a great deal more regret than she had felt on leaving her native land. Yet she was beginning to admit that damp, misty England had charms of its own, and also that poor Thorpe Somerville had claims. In rather less than a year she would be twenty-one, and a person with responsibilities and duties; also, in just about a year Harry's long leave would again be due, and it would make a difference to her home-coming—exactly how much she did not bring herself to define—if he were there to welcome or be welcomed.

As she sat thinking, all at once she felt the uncanny sensation of some one watching her very intently, and looked up, half-expecting to see Miss Fancourt coming towards her. That lady, however, was not in sight, nor was any one near; but as she lifted her head, her eyes, drawn by some mesmeric attraction, fell on a sailor at a little distance who was engaged in cleaning some of the ship's brasses. He looked away immediately, and Muriel settled herself once more; but in less than five minutes the same thing happened again. This time she rose and walked towards a group of people who were just then coming on deck, first giving a searching glance at the man who had had so strange an influence over her. The impression she carried away with her was of lithe, sinuous grace, common enough in Lascar crews; yet this man was no Lascar—of that she felt perfectly convinced. As she joined in the laughter and gay chatter of some of the younger passengers the uncomfortable sensation faded; but in a few days it was recalled to Muriel's mind in rather a sinister manner by the young ship's doctor, who came to her preferring a singular request. It appeared that one of the crew, an Englishman, was down with fever; the attack was an exceptionally severe one, and there were grave doubts of the man's recovery.

'Practically,' said the young doctor, 'he is a dead man at this moment; but his mind is so alert, his faculties so acute, his will so strong, that they dominate the physical part of him. He won't die, he declares'—and the young man laughed nervously—'until he's seen *you*.'

'Seen me!' exclaimed Muriel in astonishment. 'What can he possibly want with me? He must be raving!'

'He has been,' the doctor admitted; 'but he's sane enough now. At all events, he's so weak that he's perfectly safe. He's a most curious chap,' he continued, almost as if he could not help himself. 'He's got a wonderful kind of mesmeric force, ill as he is. And he's what's called a gentleman—or was once.'

'He has mesmerised you, I think,' Muriel said, smiling. 'You have not yet told me what it is that he wants with me.'

'Well, to tell you the truth, I hardly know myself,' the young man responded. 'He asked me to be certain to tell you that you would repent it all your life if you did not spare him the few minutes he wishes for. He can't speak for any length of time, his weakness is too appalling. Any other man would have died twelve hours ago.'

Muriel gazed beyond the man at her side over the shining expanse of water, in which was reflected a sky of cloudless blue. Little ripples

chased each other over the calm surface, each flecked with gold in the dazzling sunlight. What a day to die! Suddenly she turned to the young man, deep compassion in her eyes. 'I must see him,' she said, 'even if it is only for the sake of a dying man's whim. It may be that I remind him, so far away, of some one at home.'

Without another word, the doctor rose and offered his hand to help her from her deck-chair. 'It must be at once, if it is to be at all, for more reasons than one,' he explained. 'I don't give him more than the day. I think you're an angel. I expect I shall be sacked for this,' he went on irrelevantly, 'the minute we touch land, if the skipper comes to hear of it.'

'I expect you will,' thought Muriel, smiling faintly, and then straightway alike forgot the boyish young doctor and her own nervous qualms; for as she entered the sick man's cabin the eyes that met hers, with a burning glance full of futile longing, chafing with impotence and desire, were those of the man whom she had known in another place as Richard Cathcart. She knew him at once—recognised him, moreover, as the sailor who had had so mesmeric an influence over her a few days before; and although the sight of him, weak and on the verge of dissolution as he undoubtedly was, brought a host of painful memories surging over her like a flood, she yet felt the marvellous compelling power of those strange eyes, and acknowledged to herself that indeed she had no choice but to be there.

'So you've come,' he said, his voice stronger than his evident weakness led her to expect. 'I wonder what made you.'

'I am sorry to see you so ill,' Muriel said, feeling somehow as if she meant it.

He moved his head with the old impatient gesture she remembered so well. 'I am dying,' he said; 'ought to have been dead by this, if only you'd have let me.'

'I!' said the girl in amazement. 'What can I have to do with it?'

Very dreadful it was to hear him try to laugh. 'Not much,' he cackled; 'but I expect I've got a conscience, or a bad pain somewhere, that makes me think so. Anyway, you and Sir Hugh between you almost made me feel a man again. You'll remember that. It was too late, though; and now I'm dying—pretty quick, too, so he says,' again with that curious upward jerk of the head. The effort exhausted him, and for some minutes he lay without speaking. When at last he revived, his story, which was a long one, fell from his lips in halting, if perfectly coherent, sentences.

He spoke of his first meeting with Hugo Somerville, then a mere lad, easily attracted by an older man with a good deal more knowledge of the world than he himself possessed. Gambling and racing led to the same fatal end, and before long Cathcart had introduced the young heir of Thorpe Somerville to Isaacs the Jew money-lender. Once in the toils, there was no escape. Hugo put his name to bill after bill, and his crowning folly was to sign his father's name to a cheque for a large amount. The cheque was never presented, and therefore not dishonoured; for Cathcart obtained immediate possession of it, and easily persuaded the unfortunate Hugo that it amounted to a forgery. Under the pressure put upon him from time to time, he consented to everything that Isaacs or his instrument Cathcart suggested. Having bled Hugo as far as possible, the pair of schemers arranged that Isaacs should finance Cathcart in order to enable him to lay siege to the heiress. Hugo in the meantime was kept in ignorance of their real intentions, yet compelled to furnish information when required, and to stand by in the guise of Cathcart's body-servant.

The whole plot was so cold-blooded, so audacious, that Muriel gasped as she listened. More than once the doctor looked across from his position behind the sick man to note the effect of his revelations. He need not have been alarmed. It seemed to Muriel as if that for which she had been waiting had at last arrived: here, at last, was the clue to the mystery she had so nearly broken her heart in trying to solve.

In spite of the terrorism of Cathcart's rule, Hugo sometimes broke away from his jailer, and it was on one of these occasions that he met his sister and frightened her by demanding her watch. Fortune certainly favoured Cathcart in the affair; but the young man had been recognised by the old collie Rory, and it was clear that no time was to be lost. Not that Cathcart had ever any intention of murdering Hugo: none of those instincts were his. His villainy was of that finer type which seeks, for base purposes, the mastery over men's minds, and recks little of their wretched bodies. Nevertheless, he wanted Hugo out of the way, and out of the way the miserable heir of the Somervilles had to go. Again fate played into Cathcart's hands. Chance brought him back from London earlier than he had intended on the day of Sir Hugh Somerville's death, and when, on his return to The Lodge, he found that Hugo was missing, he set out at once to look for him. Chance again led him to direct his steps towards the Fairy Pool, where, in the course of his search for the missing Hugo, he came upon the dead body of Sir Hugh Somerville. Evidently he had slipped on the soft edge of the pool, and as he fell his gun had gone off, killing him instantly. He was dead when Cathcart found him, but his body was still warm. It was in making this discovery that Cathcart's hands touched the pocket-book in the dead man's breast-pocket, which had proved his own undoing and the source of so much grief. He took it, partly on impulse, partly with the idea that it might contain something of use to him. As it happened, there was little of any value; and he burnt the papers immediately, but—perhaps with a view to further torture—omitted to burn the case itself, trusting

famous cities and sights were fraught with too much that was painful; so that, in the newness of her grief, to revisit them so soon would have seemed like sacrilege to Muriel. Anywhere else—so only that she might avoid the pangs of memory and leave, as far as was possible, thought behind her—she was willing to go; and a tour round the world suggested itself as the most hopeful means of securing a complete recovery for the shattered nerves and numbed faculties.

One bleak day in March a sad-faced young girl, wrapped in a heavy travelling-cloak, stood on the deck of the big liner *Kielder Castle*, watching the shores of her native land recede out of sight and ken. Now, after two years, Miss Fancourt was able to congratulate herself on the prospect of ultimate success. That good woman was herself no longer young, and to settle down to spend her small income and remaining years in doing quietly the good she could had been a dream from which she was loath to part. Yet she had never for one moment hesitated, never in her inmost heart complained; and now every day brought her reward appreciably nearer. The irreconcilable grief of the very young, the hopeless and unequal fighting against the mandates of a fate as cruel as it was inexorable, were gone, with happy childhood, for ever; but to Miss Fancourt's loving eyes her charge was daily ripening into a particularly charming woman. The shadow that still lingered in the violet eyes gave her an appearance of being older than her years; but she looked, and undoubtedly was, happy, taking a new and never-ceasing interest in the various aspects life wore in the countries through which they passed.

The winter season was spent at Simla, whither Harry Markham repaired as often as the authorities would permit him to do so. The winter season was spent at Simla, whither Harry Markham repaired as often as the authorities would permit him to do so. He and Muriel became fast friends; but beyond the lines of friendship Harry never ventured, and when the approach of the hot season necessitated a move being made by the two ladies, the establishment of a tolerably frequent correspondence was the only visible result of several months of pleasant intercourse. The next point was Japan; and although Muriel thoroughly appreciated the charms of that delightful country, it is not to be denied that she missed Harry as a companion and cicerone. And perhaps the girl was not entirely sorry when a letter reached Miss Fancourt from a brother long settled in Vancouver, inviting that lady and her charge to pay him a visit of some months' duration. The invitation was accepted, and Muriel sat bidding good-bye to Japan and its cherry-blossom with a great deal more regret than she had felt on leaving her native land. Yet she was beginning to admit that damp, misty England had charms of its own, and also that poor Thorpe Somerville had claims. In rather less than a year she would be twenty-one, and a person with responsibilities and duties; also, in just about a year Harry's long leave would again be due, and it would make a difference to her home-coming—exactly how much she did not bring herself to define—if he were there to welcome or be welcomed.

As she sat thinking, all at once she felt the uncanny sensation of some one watching her very intently, and looked up, half-expecting to see Miss Fancourt coming towards her. That lady, however, was not in sight, nor was any one near; but as she lifted her head, her eyes, drawn by some mesmeric attraction, fell on a sailor at a little distance who was engaged in cleaning some of the ship's brasses. He looked away immediately, and Muriel settled herself once more; but in less than five minutes the same thing happened again. This time she rose and walked towards a group of people who were just then coming on deck, first giving a searching glance at the man who had had so strange an influence over her. The impression she carried away with her was of lithe, sinuous grace, common enough in Lascar crews; yet this man was no Lascar—of that she felt perfectly convinced. As she joined in the laughter and gay chatter of some of the younger passengers the uncomfortable sensation faded; but in a few days it was recalled to Muriel's mind in rather a sinister manner by the young ship's doctor, who came to her preferring a singular request. It appeared that one of the crew, an Englishman, was down with fever; the attack was an exceptionally severe one, and there were grave doubts of the man's recovery.

'Practically,' said the young doctor, 'he is a dead man at this moment; but his mind is so alert, his faculties so acute, his will so strong, that they dominate the physical part of him. He won't die, he declares'—and the young man laughed nervously—'until he's seen *you*.'

'Seen me!' exclaimed Muriel in astonishment. 'What can he possibly want with me? He must be raving!'

'He has been,' the doctor admitted; 'but he's sane enough now. At all events, he's so weak that he's perfectly safe. He's a most curious chap,' he continued, almost as if he could not help himself. 'He's got a wonderful kind of mesmeric force, ill as he is. And he's what's called a gentleman—or was once.'

'He has mesmerised you, I think,' Muriel said, smiling. 'You have not yet told me what it is that he wants with me.'

'Well, to tell you the truth, I hardly know myself,' the young man responded. 'He asked me to be certain to tell you that you would repent it all your life if you did not spare him the few minutes he wishes for. He can't speak for any length of time, his weakness is too appalling. Any other man would have died twelve hours ago.'

Muriel gazed beyond the man at her side over the shining expanse of water, in which was reflected a sky of cloudless blue. Little ripples

chased each other over the calm surface, each flecked with gold in the dazzling sunlight. What a day to die! Suddenly she turned to the young man, deep compassion in her eyes. 'I must see him,' she said, 'even if it is only for the sake of a dying man's whim. It may be that I remind him, so far away, of some one at home.'

Without another word, the doctor rose and offered his hand to help her from her deck-chair. 'It must be at once, if it is to be at all, for more reasons than one,' he explained. 'I don't give him more than the day. I think you're an angel. I expect I shall be sacked for this,' he went on irrelevantly, 'the minute we touch land, if the skipper comes to hear of it.'

'I expect you will,' thought Muriel, smiling faintly, and then straightway alike forgot the boyish young doctor and her own nervous qualms; for as she entered the sick man's cabin the eyes that met hers, with a burning glance full of futile longing, chafing with impotence and desire, were those of the man whom she had known in another place as Richard Cathcart. She knew him at once—recognised him, moreover, as the sailor who had had so mesmeric an influence over her a few days before; and although the sight of him, weak and on the verge of dissolution as he undoubtedly was, brought a host of painful memories surging over her like a flood, she yet felt the marvellous compelling power of those strange eyes, and acknowledged to herself that indeed she had no choice but to be there.

'So you've come,' he said, his voice stronger than his evident weakness led her to expect. 'I wonder what made you.'

'I am sorry to see you so ill,' Muriel said, feeling somehow as if she meant it.

He moved his head with the old impatient gesture she remembered so well. 'I am dying,' he said; 'ought to have been dead by this, if only you'd have let me.'

'I!' said the girl in amazement. 'What can I have to do with it?'

Very dreadful it was to hear him try to laugh. 'Not much,' he cackled; 'but I expect I've got a conscience, or a bad pain somewhere, that makes me think so. Anyway, you and Sir Hugh between you almost made me feel a man again. You'll remember that. It was too late, though; and now I'm dying—pretty quick, too, so he says,' again with that curious upward jerk of the head. The effort exhausted him, and for some minutes he lay without speaking. When at last he revived, his story, which was a long one, fell from his lips in halting, if perfectly coherent, sentences.

He spoke of his first meeting with Hugo Somerville, then a mere lad, easily attracted by an older man with a good deal more knowledge of the world than he himself possessed. Gambling and racing led to the same fatal end, and before long Cathcart had introduced the young heir of Thorpe Somerville to Isaacs the Jew money-lender. Once in the toils, there was no escape. Hugo put his name to bill after bill, and his crowning folly was to sign his father's name to a cheque for a large amount. The cheque was never presented, and therefore not dishonoured; for Cathcart obtained immediate possession of it, and easily persuaded the unfortunate Hugo that it amounted to a forgery. Under the pressure put upon him from time to time, he consented to everything that Isaacs or his instrument Cathcart suggested. Having bled Hugo as far as possible, the pair of schemers arranged that Isaacs should finance Cathcart in order to enable him to lay siege to the heiress. Hugo in the meantime was kept in ignorance of their real intentions, yet compelled to furnish information when required, and to stand by in the guise of Cathcart's body-servant.

The whole plot was so cold-blooded, so audacious, that Muriel gasped as she listened. More than once the doctor looked across from his position behind the sick man to note the effect of his revelations. He need not have been alarmed. It seemed to Muriel as if that for which she had been waiting had at last arrived: here, at last, was the clue to the mystery she had so nearly broken her heart in trying to solve.

In spite of the terrorism of Cathcart's rule, Hugo sometimes broke away from his jailer, and it was on one of these occasions that he met his sister and frightened her by demanding her watch. Fortune certainly favoured Cathcart in the affair; but the young man had been recognised by the old collie Rory, and it was clear that no time was to be lost. Not that Cathcart had ever any intention of murdering Hugo: none of those instincts were his. His villainy was of that finer type which seeks, for base purposes, the mastery over men's minds, and recks little of their wretched bodies. Nevertheless, he wanted Hugo out of the way, and out of the way the miserable heir of the Somervilles had to go. Again fate played into Cathcart's hands. Chance brought him back from London earlier than he had intended on the day of Sir Hugh Somerville's death, and when, on his return to The Lodge, he found that Hugo was missing, he set out at once to look for him. Chance again led him to direct his steps towards the Fairy Pool, where, in the course of his search for the missing Hugo, he came upon the dead body of Sir Hugh Somerville. Evidently he had slipped on the soft edge of the pool, and as he fell his gun had gone off, killing him instantly. He was dead when Cathcart found him, but his body was still warm. It was in making this discovery that Cathcart's hands touched the pocket-book in the dead man's breast-pocket, which had proved his own undoing and the source of so much grief. He took it, partly on impulse, partly with the idea that it might contain something of use to him. As it happened, there was little of any value; and he burnt the papers immediately, but—perhaps with a view to further torture—omitted to burn the case itself, trusting

famous cities and sights were fraught with too much that was painful; so that, in the newness of her grief, to revisit them so soon would have seemed like sacrilege to Muriel. Anywhere else—so only that she might avoid the pangs of memory and leave, as far as was possible, thought behind her—she was willing to go; and a tour round the world suggested itself as the most hopeful means of securing a complete recovery for the shattered nerves and numbed faculties.

One bleak day in March a sad-faced young girl, wrapped in a heavy travelling-cloak, stood on the deck of the big liner *Kielder Castle*, watching the shores of her native land recede out of sight and ken. Now, after two years, Miss Fancourt was able to congratulate herself on the prospect of ultimate success. That good woman was herself no longer young, and to settle down to spend her small income and remaining years in doing quietly the good she could had been a dream from which she was loath to part. Yet she had never for one moment hesitated, never in her inmost heart complained; and now every day brought her reward appreciably nearer. The irreconcilable grief of the very young, the hopeless and unequal fighting against the mandates of a fate as cruel as it was inexorable, were gone, with happy childhood, for ever; but to Miss Fancourt's loving eyes her charge was daily ripening into a particularly charming woman. The shadow that still lingered in the violet eyes gave her an appearance of being older than her years; but she looked, and undoubtedly was, happy, taking a new and never-ceasing interest in the various aspects life wore in the countries through which they passed.

The winter season was spent at Simla, whither Harry Markham repaired as often as the authorities would permit him to do so. He and Muriel became fast friends; but beyond the lines of friendship Harry never ventured, and when the approach of the hot season necessitated a move being made by the two ladies, the establishment of a tolerably frequent correspondence was the only visible result of several months of pleasant intercourse. The next point was Japan; and although Muriel thoroughly appreciated the charms of that delightful country, it is not to be denied that she missed Harry as a companion and cicerone. And perhaps the girl was not entirely sorry when a letter reached Miss Fancourt from a brother long settled in Vancouver, inviting that lady and her charge to pay him a visit of some months' duration. The invitation was accepted, and Muriel sat bidding good-bye to Japan and its cherry-blossom with a great deal more regret than she had felt on leaving her native land. Yet she was beginning to admit that damp, misty England had charms of its own, and also that poor Thorpe Somerville had claims. In rather less than a year she would be twenty-one, and a person with responsibilities and duties; also, in just about a year Harry's long leave would again be due, and it would make a difference to her home-coming—exactly how much she did not bring herself to define—if he were there to welcome or be welcomed.

As she sat thinking, all at once she felt the uncanny sensation of some one watching her very intently, and looked up, half-expecting to see Miss Fancourt coming towards her. That lady, however, was not in sight, nor was any one near; but as she lifted her head, her eyes, drawn by some mesmeric attraction, fell on a sailor at a little distance who was engaged in cleaning some of the ship's brasses. He looked away immediately, and Muriel settled herself once more; but in less than five minutes the same thing happened again. This time she rose and walked towards a group of people who were just then coming on deck, first giving a searching glance at the man who had had so strange an influence over her. The impression she carried away with her was of lithe, sinuous grace, common enough in Lascar crews; yet this man was no Lascar—of that she felt perfectly convinced. As she joined in the laughter and gay chatter of some of the younger passengers the uncomfortable sensation faded; but in a few days it was recalled to Muriel's mind in rather a sinister manner by the young ship's doctor, who came to her preferring a singular request. It appeared that one of the crew, an Englishman, was down with fever; the attack was an exceptionally severe one, and there were grave doubts of the man's recovery.

'Practically,' said the young doctor, 'he is a dead man at this moment; but his mind is so alert, his faculties so acute, his will so strong, that they dominate the physical part of him. He won't die, he declares'—and the young man laughed nervously—'until he's seen *you*.'

'Seen me!' exclaimed Muriel in astonishment. 'What can he possibly want with me? He must be raving!'

'He has been,' the doctor admitted; 'but he's sane enough now. At all events, he's so weak that he's perfectly safe. He's a most curious chap,' he continued, almost as if he could not help himself. 'He's got a wonderful kind of mesmeric force, ill as he is. And he's what's called a gentleman—or was once.'

'He has mesmerised you, I think,' Muriel said, smiling. 'You have not yet told me what it is that he wants with me.'

'Well, to tell you the truth, I hardly know myself,' the young man responded. 'He asked me to be certain to tell you that you would repent it all your life if you did not spare him the few minutes he wishes for. He can't speak for any length of time, his weakness is too appalling. Any other man would have died twelve hours ago.'

Muriel gazed beyond the man at her side over the shining expanse of water, in which was reflected a sky of cloudless blue. Little ripples

chased each other over the calm surface, each flecked with gold in the dazzling sunlight. What a day to die! Suddenly she turned to the young man, deep compassion in her eyes. 'I must see him,' she said, 'even if it is only for the sake of a dying man's whim. It may be that I remind him, so far away, of some one at home.'

Without another word, the doctor rose and offered his hand to help her from her deck-chair. 'It must be at once, if it is to be at all, for more reasons than one,' he explained. 'I don't give him more than the day. I think you're an angel. I expect I shall be sacked for this,' he went on irrelevantly, 'the minute we touch land, if the skipper comes to hear of it.'

'I expect you will,' thought Muriel, smiling faintly, and then straightway alike forgot the boyish young doctor and her own nervous qualms; for as she entered the sick man's cabin the eyes that met hers, with a burning glance full of futile longing, chafing with impotence and desire, were those of the man whom she had known in another place as Richard Cathcart. She knew him at once—recognised him, moreover, as the sailor who had had so mesmeric an influence over her a few days before; and although the sight of him, weak and on the verge of dissolution as he undoubtedly was, brought a host of painful memories surging over her like a flood, she yet felt the marvellous compelling power of those strange eyes, and acknowledged to herself that indeed she had no choice but to be there.

'So you've come,' he said, his voice stronger than his evident weakness led her to expect. 'I wonder what made you.'

'I am sorry to see you so ill,' Muriel said, feeling somehow as if she meant it.

He moved his head with the old impatient gesture she remembered so well. 'I am dying,' he said; 'ought to have been dead by this, if only you'd have let me.'

'I!' said the girl in amazement. 'What can I have to do with it?'

Very dreadful it was to hear him try to laugh. 'Not much,' he cackled; 'but I expect I've got a conscience, or a bad pain somewhere, that makes me think so. Anyway, you and Sir Hugh between you almost made me feel a man again. You'll remember that. It was too late, though; and now I'm dying—pretty quick, too, so he says,' again with that curious upward jerk of the head. The effort exhausted him, and for some minutes he lay without speaking. When at last he revived, his story, which was a long one, fell from his lips in halting, if perfectly coherent, sentences.

He spoke of his first meeting with Hugo Somerville, then a mere lad, easily attracted by an older man with a good deal more knowledge of the world than he himself possessed. Gambling and racing led to the same fatal end, and before long Cathcart had introduced the young heir of Thorpe Somerville to Isaacs the Jew money-lender. Once in the toils, there was no escape. Hugo put his name to bill after bill, and his crowning folly was to sign his father's name to a cheque for a large amount. The cheque was never presented, and therefore not dishonoured; for Cathcart obtained immediate possession of it, and easily persuaded the unfortunate Hugo that it amounted to a forgery. Under the pressure put upon him from time to time, he consented to everything that Isaacs or his instrument Cathcart suggested. Having bled Hugo as far as possible, the pair of schemers arranged that Isaacs should finance Cathcart in order to enable him to lay siege to the heiress. Hugo in the meantime was kept in ignorance of their real intentions, yet compelled to furnish information when required, and to stand by in the guise of Cathcart's body-servant.

The whole plot was so cold-blooded, so audacious, that Muriel gasped as she listened. More than once the doctor looked across from his position behind the sick man to note the effect of his revelations. He need not have been alarmed. It seemed to Muriel as if that for which she had been waiting had at last arrived: here, at last, was the clue to the mystery she had so nearly broken her heart in trying to solve.

In spite of the terrorism of Cathcart's rule, Hugo sometimes broke away from his jailer, and it was on one of these occasions that he met his sister and frightened her by demanding her watch. Fortune certainly favoured Cathcart in the affair; but the young man had been recognised by the old collie Rory, and it was clear that no time was to be lost. Not that Cathcart had ever any intention of murdering Hugo: none of those instincts were his. His villainy was of that finer type which seeks, for base purposes, the mastery over men's minds, and recks little of their wretched bodies. Nevertheless, he wanted Hugo out of the way, and out of the way the miserable heir of the Somervilles had to go. Again fate played into Cathcart's hands. Chance brought him back from London earlier than he had intended on the day of Sir Hugh Somerville's death, and when, on his return to The Lodge, he found that Hugo was missing, he set out at once to look for him. Chance again led him to direct his steps towards the Fairy Pool, where, in the course of his search for the missing Hugo, he came upon the dead body of Sir Hugh Somerville. Evidently he had slipped on the soft edge of the pool, and as he fell his gun had gone off, killing him instantly. He was dead when Cathcart found him, but his body was still warm. It was in making this discovery that Cathcart's hands touched the pocket-book in the dead man's breast-pocket, which had proved his own undoing and the source of so much grief. He took it, partly on impulse, partly with the idea that it might contain something of use to him. As it happened, there was little of any value; and he burnt the papers immediately, but—perhaps with a view to further torture—omitted to burn the case itself, trusting

famous cities and sights were fraught with too much that was painful; so that, in the newness of her grief, to revisit them so soon would have seemed like sacrilege to Muriel. Anywhere else—so only that she might avoid the pangs of memory and leave, as far as was possible, thought behind her—she was willing to go; and a tour round the world suggested itself as the most hopeful means of securing a complete recovery for the shattered nerves and numbed faculties.

One bleak day in March a sad-faced young girl, wrapped in a heavy travelling-cloak, stood on the deck of the big liner *Kielder Castle*, watching the shores of her native land recede out of sight and ken. Now, after two years, Miss Fancourt was able to congratulate herself on the prospect of ultimate success. That good woman was herself no longer young, and to settle down to spend her small income and remaining years in doing quietly the good she could had been a dream from which she was loath to part. Yet she had never for one moment hesitated, never in her inmost heart complained; and now every day brought her reward appreciably nearer. The irreconcilable grief of the very young, the hopeless and unequal fighting against the mandates of a fate as cruel as it was inexorable, were gone, with happy childhood, for ever; but to Miss Fancourt's loving eyes her charge was daily ripening into a particularly charming woman. The shadow that still lingered in the violet eyes gave her an appearance of being older than her years; but she looked, and undoubtedly was, happy, taking a new and never-ceasing interest in the various aspects life wore in the countries through which they passed.

The winter season was spent at Simla, whither Harry Markham repaired as often as the authorities would permit him to do so. He and Muriel became fast friends; but beyond the lines of friendship Harry never ventured, and when the approach of the hot season necessitated a move being made by the two ladies, the establishment of a tolerably frequent correspondence was the only visible result of several months of pleasant intercourse. The next point was Japan; and although Muriel thoroughly appreciated the charms of that delightful country, it is not to be denied that she missed Harry as a companion and cicerone. And perhaps the girl was not entirely sorry when a letter reached Miss Fancourt from a brother long settled in Vancouver, inviting that lady and her charge to pay him a visit of some months' duration. The invitation was accepted, and Muriel sat bidding good-bye to Japan and its cherry-blossom with a great deal more regret than she had felt on leaving her native land. Yet she was beginning to admit that damp, misty England had charms of its own, and also that poor Thorpe Somerville had claims. In rather less than a year she would be twenty-one, and a person with responsibilities and duties; also, in just about a year Harry's long leave would again be due, and it would make a difference to her home-coming—exactly how much she did not bring herself to define—if he were there to welcome or be welcomed.

The invitation was accepted, and Muriel sat bidding good-bye to Japan and its cherry-blossom with a great deal more regret than she had felt on leaving her native land. Yet she was beginning to admit that damp, misty England had charms of its own, and also that poor Thorpe Somerville had claims. In rather less than a year she would be twenty-one, and a person with responsibilities and duties; also, in just about a year Harry's long leave would again be due, and it would make a difference to her home-coming—exactly how much she did not bring herself to define—if he were there to welcome or be welcomed.

As she sat thinking, all at once she felt the uncanny sensation of some one watching her very intently, and looked up, half-expecting to see Miss Fancourt coming towards her. That lady, however, was not in sight, nor was any one near; but as she lifted her head, her eyes, drawn by some mesmeric attraction, fell on a sailor at a little distance who was engaged in cleaning some of the ship's brasses. He looked away immediately, and Muriel settled herself once more; but in less than five minutes the same thing happened again. This time she rose and walked towards a group of people who were just then coming on deck, first giving a searching glance at the man who had had so strange an influence over her. The impression she carried away with her was of lithe, sinuous grace, common enough in Lascar crews; yet this man was no Lascar—of that she felt perfectly convinced. As she joined in the laughter and gay chatter of some of the younger passengers the uncomfortable sensation faded; but in a few days it was recalled to Muriel's mind in rather a sinister manner by the young ship's doctor, who came to her preferring a singular request. It appeared that one of the crew, an Englishman, was down with fever; the attack was an exceptionally severe one, and there were grave doubts of the man's recovery.

'Practically,' said the young doctor, 'he is a dead man at this moment; but his mind is so alert, his faculties so acute, his will so strong, that they dominate the physical part of him. He won't die, he declares'—and the young man laughed nervously—'until he's seen *you*.'

'Seen me!' exclaimed Muriel in astonishment. 'What can he possibly want with me? He must be raving!'

'He has been,' the doctor admitted; 'but he's sane enough now. At all events, he's so weak that he's perfectly safe. He's a most curious chap,' he continued, almost as if he could not help himself. 'He's got a wonderful kind of mesmeric force, ill as he is. And he's what's called a gentleman—or was once.'

'He has mesmerised you, I think,' Muriel said, smiling. 'You have not yet told me what it is that he wants with me.'

'Well, to tell you the truth, I hardly know myself,' the young man responded. 'He asked me to be certain to tell you that you would repent it all your life if you did not spare him the few minutes he wishes for. He can't speak for any length of time, his weakness is too appalling. Any other man would have died twelve hours ago.'

Muriel gazed beyond the man at her side over the shining expanse of water, in which was reflected a sky of cloudless blue. Little ripples

chased each other over the calm surface, each flecked with gold in the dazzling sunlight. What a day to die! Suddenly she turned to the young man, deep compassion in her eyes. 'I must see him,' she said, 'even if it is only for the sake of a dying man's whim. It may be that I remind him, so far away, of some one at home.'

Without another word, the doctor rose and offered his hand to help her from her deck-chair. 'It must be at once, if it is to be at all, for more reasons than one,' he explained. 'I don't give him more than the day. I think you're an angel. I expect I shall be sacked for this,' he went on irrelevantly, 'the minute we touch land, if the skipper comes to hear of it.'

'I expect you will,' thought Muriel, smiling faintly, and then straightway alike forgot the boyish young doctor and her own nervous qualms; for as she entered the sick man's cabin the eyes that met hers, with a burning glance full of futile longing, chafing with impotence and desire, were those of the man whom she had known in another place as Richard Cathcart. She knew him at once—recognised him, moreover, as the sailor who had had so mesmeric an influence over her a few days before; and although the sight of him, weak and on the verge of dissolution as he undoubtedly was, brought a host of painful memories surging over her like a flood, she yet felt the marvellous compelling power of those strange eyes, and acknowledged to herself that indeed she had no choice but to be there.

'So you've come,' he said, his voice stronger than his evident weakness led her to expect. 'I wonder what made you.'

'I am sorry to see you so ill,' Muriel said, feeling somehow as if she meant it.

He moved his head with the old impatient gesture she remembered so well. 'I am dying,' he said; 'ought to have been dead by this, if only you'd have let me.'

'I!' said the girl in amazement. 'What can I have to do with it?'

Very dreadful it was to hear him try to laugh. 'Not much,' he cackled; 'but I expect I've got a conscience, or a bad pain somewhere, that makes me think so. Anyway, you and Sir Hugh between you almost made me feel a man again. You'll remember that. It was too late, though; and now I'm dying—pretty quick, too, so he says,' again with that curious upward jerk of the head. The effort exhausted him, and for some minutes he lay without speaking. When at last he revived, his story, which was a long one, fell from his lips in halting, if perfectly coherent, sentences.

He spoke of his first meeting with Hugo Somerville, then a mere lad, easily attracted by an older man with a good deal more knowledge of the world than he himself possessed. Gambling and racing led to the same fatal end, and before long Cathcart had introduced the young heir of Thorpe Somerville to Isaacs the Jew money-lender. Once in the toils, there was no escape. Hugo put his name to bill after bill, and his crowning folly was to sign his father's name to a cheque for a large amount. The cheque was never presented, and therefore not dishonoured; for Cathcart obtained immediate possession of it, and easily persuaded the unfortunate Hugo that it amounted to a forgery. Under the pressure put upon him from time to time, he consented to everything that Isaacs or his instrument Cathcart suggested. Having bled Hugo as far as possible, the pair of schemers arranged that Isaacs should finance Cathcart in order to enable him to lay siege to the heiress. Hugo in the meantime was kept in ignorance of their real intentions, yet compelled to furnish information when required, and to stand by in the guise of Cathcart's body-servant.

The whole plot was so cold-blooded, so audacious, that Muriel gasped as she listened. More than once the doctor looked across from his position behind the sick man to note the effect of his revelations. He need not have been alarmed. It seemed to Muriel as if that for which she had been waiting had at last arrived: here, at last, was the clue to the mystery she had so nearly broken her heart in trying to solve.

In spite of the terrorism of Cathcart's rule, Hugo sometimes broke away from his jailer, and it was on one of these occasions that he met his sister and frightened her by demanding her watch. Fortune certainly favoured Cathcart in the affair; but the young man had been recognised by the old collie Rory, and it was clear that no time was to be lost. Not that Cathcart had ever any intention of murdering Hugo: none of those instincts were his. His villainy was of that finer type which seeks, for base purposes, the mastery over men's minds, and recks little of their wretched bodies. Nevertheless, he wanted Hugo out of the way, and out of the way the miserable heir of the Somervilles had to go. Again fate played into Cathcart's hands. Chance brought him back from London earlier than he had intended on the day of Sir Hugh Somerville's death, and when, on his return to The Lodge, he found that Hugo was missing, he set out at once to look for him. Chance again led him to direct his steps towards the Fairy Pool, where, in the course of his search for the missing Hugo, he came upon the dead body of Sir Hugh Somerville. Evidently he had slipped on the soft edge of the pool, and as he fell his gun had gone off, killing him instantly. He was dead when Cathcart found him, but his body was still warm. It was in making this discovery that Cathcart's hands touched the pocket-book in the dead man's breast-pocket, which had proved his own undoing and the source of so much grief. He took it, partly on impulse, partly with the idea that it might contain something of use to him. As it happened, there was little of any value; and he burnt the papers immediately, but—perhaps with a view to further torture—omitted to burn the case itself, trusting

famous cities and sights were fraught with too much that was painful; so that, in the newness of her grief, to revisit them so soon would have seemed like sacrilege to Muriel. Anywhere else—so only that she might avoid the pangs of memory and leave, as far as was possible, thought behind her—she was willing to go; and a tour round the world suggested itself as the most hopeful means of securing a complete recovery for the shattered nerves and numbed faculties.

One bleak day in March a sad-faced young girl, wrapped in a heavy travelling-cloak, stood on the deck of the big liner *Kielder Castle*, watching the shores of her native land recede out of sight and ken. Now, after two years, Miss Fancourt was able to congratulate herself on the prospect of ultimate success. That good woman was herself no longer young, and to settle down to spend her small income and remaining years in doing quietly the good she could had been a dream from which she was loath to part. Yet she had never for one moment hesitated, never in her inmost heart complained; and now every day brought her reward appreciably nearer. The irreconcilable grief of the very young, the hopeless and unequal fighting against the mandates of a fate as cruel as it was inexorable, were gone, with happy childhood, for ever; but to Miss Fancourt's loving eyes her charge was daily ripening into a particularly charming woman. The shadow that still lingered in the violet eyes gave her an appearance of being older than her years; but she looked, and undoubtedly was, happy, taking a new and never-ceasing interest in the various aspects life wore in the countries through which they passed.

The winter season was spent at Simla, whither Harry Markham repaired as often as the authorities would permit him to do so. He and Muriel became fast friends; but beyond the lines of friendship Harry never ventured, and when the approach of the hot season necessitated a move being made by the two ladies, the establishment of a tolerably frequent correspondence was the only visible result of several months of pleasant intercourse. The next point was Japan; and although Muriel thoroughly appreciated the charms of that delightful country, it is not to be denied that she missed Harry as a companion and cicerone. And perhaps the girl was not entirely sorry when a letter reached Miss Fancourt from a brother long settled in Vancouver, inviting that lady and her charge to pay him a visit of some months' duration. The invitation was accepted, and Muriel sat bidding good-bye to Japan and its cherry-blossom with a great deal more regret than she had felt on leaving her native land. Yet she was beginning to admit that damp, misty England had charms of its own, and also that poor Thorpe Somerville had claims. In rather less than a year she would be twenty-one, and a person with responsibilities and duties; also, in just about a year Harry's long leave would again be due, and it would make a difference to her home-coming—exactly how much she did not bring herself to define—if he were there to welcome or be welcomed.

Yet she was beginning to admit that damp, misty England had charms of its own, and also that poor Thorpe Somerville had claims. In rather less than a year she would be twenty-one, and a person with responsibilities and duties; also, in just about a year Harry's long leave would again be due, and it would make a difference to her home-coming—exactly how much she did not bring herself to define—if he were there to welcome or be welcomed.

As she sat thinking, all at once she felt the uncanny sensation of some one watching her very intently, and looked up, half-expecting to see Miss Fancourt coming towards her. That lady, however, was not in sight, nor was any one near; but as she lifted her head, her eyes, drawn by some mesmeric attraction, fell on a sailor at a little distance who was engaged in cleaning some of the ship's brasses. He looked away immediately, and Muriel settled herself once more; but in less than five minutes the same thing happened again. This time she rose and walked towards a group of people who were just then coming on deck, first giving a searching glance at the man who had had so strange an influence over her. The impression she carried away with her was of lithe, sinuous grace, common enough in Lascar crews; yet this man was no Lascar—of that she felt perfectly convinced. As she joined in the laughter and gay chatter of some of the younger passengers the uncomfortable sensation faded; but in a few days it was recalled to Muriel's mind in rather a sinister manner by the young ship's doctor, who came to her preferring a singular request. It appeared that one of the crew, an Englishman, was down with fever; the attack was an exceptionally severe one, and there were grave doubts of the man's recovery.

'Practically,' said the young doctor, 'he is a dead man at this moment; but his mind is so alert, his faculties so acute, his will so strong, that they dominate the physical part of him. He won't die, he declares'—and the young man laughed nervously—'until he's seen *you*.'

'Seen me!' exclaimed Muriel in astonishment. 'What can he possibly want with me? He must be raving!'

'He has been,' the doctor admitted; 'but he's sane enough now. At all events, he's so weak that he's perfectly safe. He's a most curious chap,' he continued, almost as if he could not help himself. 'He's got a wonderful kind of mesmeric force, ill as he is. And he's what's called a gentleman—or was once.'

'He has mesmerised you, I think,' Muriel said, smiling. 'You have not yet told me what it is that he wants with me.'

'Well, to tell you the truth, I hardly know myself,' the young man responded. 'He asked me to be certain to tell you that you would repent it all your life if you did not spare him the few minutes he wishes for. He can't speak for any length of time, his weakness is too appalling. Any other man would have died twelve hours ago.'

Muriel gazed beyond the man at her side over the shining expanse of water, in which was reflected a sky of cloudless blue. Little ripples

chased each other over the calm surface, each flecked with gold in the dazzling sunlight. What a day to die! Suddenly she turned to the young man, deep compassion in her eyes. 'I must see him,' she said, 'even if it is only for the sake of a dying man's whim. It may be that I remind him, so far away, of some one at home.'

Without another word, the doctor rose and offered his hand to help her from her deck-chair. 'It must be at once, if it is to be at all, for more reasons than one,' he explained. 'I don't give him more than the day. I think you're an angel. I expect I shall be sacked for this,' he went on irrelevantly, 'the minute we touch land, if the skipper comes to hear of it.'

'I expect you will,' thought Muriel, smiling faintly, and then straightway alike forgot the boyish young doctor and her own nervous qualms; for as she entered the sick man's cabin the eyes that met hers, with a burning glance full of futile longing, chafing with impotence and desire, were those of the man whom she had known in another place as Richard Cathcart. She knew him at once—recognised him, moreover, as the sailor who had had so mesmeric an influence over her a few days before; and although the sight of him, weak and on the verge of dissolution as he undoubtedly was, brought a host of painful memories surging over her like a flood, she yet felt the marvellous compelling power of those strange eyes, and acknowledged to herself that indeed she had no choice but to be there.

'So you've come,' he said, his voice stronger than his evident weakness led her to expect. 'I wonder what made you.'

'I am sorry to see you so ill,' Muriel said, feeling somehow as if she meant it.

He moved his head with the old impatient gesture she remembered so well. 'I am dying,' he said; 'ought to have been dead by this, if only you'd have let me.'

'I!' said the girl in amazement. 'What can I have to do with it?'

Very dreadful it was to hear him try to laugh. 'Not much,' he cackled; 'but I expect I've got a conscience, or a bad pain somewhere, that makes me think so. Anyway, you and Sir Hugh between you almost made me feel a man again. You'll remember that. It was too late, though; and now I'm dying—pretty quick, too, so he says,' again with that curious upward jerk of the head. The effort exhausted him, and for some minutes he lay without speaking. When at last he revived, his story, which was a long one, fell from his lips in halting, if perfectly coherent, sentences.

He spoke of his first meeting with Hugo Somerville, then a mere lad, easily attracted by an older man with a good deal more knowledge of the world than he himself possessed. Gambling and racing led to the same fatal end, and before long Cathcart had introduced the young heir of Thorpe Somerville to Isaacs the Jew money-lender. Once in the toils, there was no escape. Hugo put his name to bill after bill, and his crowning folly was to sign his father's name to a cheque for a large amount. The cheque was never presented, and therefore not dishonoured; for Cathcart obtained immediate possession of it, and easily persuaded the unfortunate Hugo that it amounted to a forgery. Under the pressure put upon him from time to time, he consented to everything that Isaacs or his instrument Cathcart suggested. Having bled Hugo as far as possible, the pair of schemers arranged that Isaacs should finance Cathcart in order to enable him to lay siege to the heiress. Hugo in the meantime was kept in ignorance of their real intentions, yet compelled to furnish information when required, and to stand by in the guise of Cathcart's body-servant.

The whole plot was so cold-blooded, so audacious, that Muriel gasped as she listened. More than once the doctor looked across from his position behind the sick man to note the effect of his revelations. He need not have been alarmed. It seemed to Muriel as if that for which she had been waiting had at last arrived: here, at last, was the clue to the mystery she had so nearly broken her heart in trying to solve.

In spite of the terrorism of Cathcart's rule, Hugo sometimes broke away from his jailer, and it was on one of these occasions that he met his sister and frightened her by demanding her watch. Fortune certainly favoured Cathcart in the affair; but the young man had been recognised by the old collie Rory, and it was clear that no time was to be lost. Not that Cathcart had ever any intention of murdering Hugo: none of those instincts were his. His villainy was of that finer type which seeks, for base purposes, the mastery over men's minds, and recks little of their wretched bodies. Nevertheless, he wanted Hugo out of the way, and out of the way the miserable heir of the Somervilles had to go. Again fate played into Cathcart's hands. Chance brought him back from London earlier than he had intended on the day of Sir Hugh Somerville's death, and when, on his return to The Lodge, he found that Hugo was missing, he set out at once to look for him. Chance again led him to direct his steps towards the Fairy Pool, where, in the course of his search for the missing Hugo, he came upon the dead body of Sir Hugh Somerville. Evidently he had slipped on the soft edge of the pool, and as he fell his gun had gone off, killing him instantly. He was dead when Cathcart found him, but his body was still warm. It was in making this discovery that Cathcart's hands touched the pocket-book in the dead man's breast-pocket, which had proved his own undoing and the source of so much grief. He took it, partly on impulse, partly with the idea that it might contain something of use to him. As it happened, there was little of any value; and he burnt the papers immediately, but—perhaps with a view to further torture—omitted to burn the case itself, trusting

famous cities and sights were fraught with too much that was painful; so that, in the newness of her grief, to revisit them so soon would have seemed like sacrilege to Muriel. Anywhere else—so only that she might avoid the pangs of memory and leave, as far as was possible, thought behind her—she was willing to go; and a tour round the world suggested itself as the most hopeful means of securing a complete recovery for the shattered nerves and numbed faculties.

One bleak day in March a sad-faced young girl, wrapped in a heavy travelling-cloak, stood on the deck of the big liner *Kielder Castle*, watching the shores of her native land recede out of sight and ken. Now, after two years, Miss Fancourt was able to congratulate herself on the prospect of ultimate success. That good woman was herself no longer young, and to settle down to spend her small income and remaining years in doing quietly the good she could had been a dream from which she was loath to part. Yet she had never for one moment hesitated, never in her inmost heart complained; and now every day brought her reward appreciably nearer. The irreconcilable grief of the very young, the hopeless and unequal fighting against the mandates of a fate as cruel as it was inexorable, were gone, with happy childhood, for ever; but to Miss Fancourt's loving eyes her charge was daily ripening into a particularly charming woman. The shadow that still lingered in the violet eyes gave her an appearance of being older than her years; but she looked, and undoubtedly was, happy, taking a new and never-ceasing interest in the various aspects life wore in the countries through which they passed.

The winter season was spent at Simla, whither Harry Markham repaired as often as the authorities would permit him to do so. He and Muriel became fast friends; but beyond the lines of friendship Harry never ventured, and when the approach of the hot season necessitated a move being made by the two ladies, the establishment of a tolerably frequent correspondence was the only visible result of several months of pleasant intercourse. The next point was Japan; and although Muriel thoroughly appreciated the charms of that delightful country, it is not to be denied that she missed Harry as a companion and cicerone. And perhaps the girl was not entirely sorry when a letter reached Miss Fancourt from a brother long settled in Vancouver, inviting that lady and her charge to pay him a visit of some months' duration. The invitation was accepted, and Muriel sat bidding good-bye to Japan and its cherry-blossom with a great deal more regret than she had felt on leaving her native land. Yet she was beginning to admit that damp, misty England had charms of its own, and also that poor Thorpe Somerville had claims. In rather less than a year she would be twenty-one, and a person with responsibilities and duties; also, in just about a year Harry's long leave would again be due, and it would make a difference to her home-coming—exactly how much she did not bring herself to define—if he were there to welcome or be welcomed.

In rather less than a year she would be twenty-one, and a person with responsibilities and duties; also, in just about a year Harry's long leave would again be due, and it would make a difference to her home-coming—exactly how much she did not bring herself to define—if he were there to welcome or be welcomed.

As she sat thinking, all at once she felt the uncanny sensation of some one watching her very intently, and looked up, half-expecting to see Miss Fancourt coming towards her. That lady, however, was not in sight, nor was any one near; but as she lifted her head, her eyes, drawn by some mesmeric attraction, fell on a sailor at a little distance who was engaged in cleaning some of the ship's brasses. He looked away immediately, and Muriel settled herself once more; but in less than five minutes the same thing happened again. This time she rose and walked towards a group of people who were just then coming on deck, first giving a searching glance at the man who had had so strange an influence over her. The impression she carried away with her was of lithe, sinuous grace, common enough in Lascar crews; yet this man was no Lascar—of that she felt perfectly convinced. As she joined in the laughter and gay chatter of some of the younger passengers the uncomfortable sensation faded; but in a few days it was recalled to Muriel's mind in rather a sinister manner by the young ship's doctor, who came to her preferring a singular request. It appeared that one of the crew, an Englishman, was down with fever; the attack was an exceptionally severe one, and there were grave doubts of the man's recovery.

'Practically,' said the young doctor, 'he is a dead man at this moment; but his mind is so alert, his faculties so acute, his will so strong, that they dominate the physical part of him. He won't die, he declares'—and the young man laughed nervously—'until he's seen *you*.'

'Seen me!' exclaimed Muriel in astonishment. 'What can he possibly want with me? He must be raving!'

'He has been,' the doctor admitted; 'but he's sane enough now. At all events, he's so weak that he's perfectly safe. He's a most curious chap,' he continued, almost as if he could not help himself. 'He's got a wonderful kind of mesmeric force, ill as he is. And he's what's called a gentleman—or was once.'

'He has mesmerised you, I think,' Muriel said, smiling. 'You have not yet told me what it is that he wants with me.'

'Well, to tell you the truth, I hardly know myself,' the young man responded. 'He asked me to be certain to tell you that you would repent it all your life if you did not spare him the few minutes he wishes for. He can't speak for any length of time, his weakness is too appalling. Any other man would have died twelve hours ago.'

Muriel gazed beyond the man at her side over the shining expanse of water, in which was reflected a sky of cloudless blue. Little ripples

chased each other over the calm surface, each flecked with gold in the dazzling sunlight. What a day to die! Suddenly she turned to the young man, deep compassion in her eyes. 'I must see him,' she said, 'even if it is only for the sake of a dying man's whim. It may be that I remind him, so far away, of some one at home.'

Without another word, the doctor rose and offered his hand to help her from her deck-chair. 'It must be at once, if it is to be at all, for more reasons than one,' he explained. 'I don't give him more than the day. I think you're an angel. I expect I shall be sacked for this,' he went on irrelevantly, 'the minute we touch land, if the skipper comes to hear of it.'

'I expect you will,' thought Muriel, smiling faintly, and then straightway alike forgot the boyish young doctor and her own nervous qualms; for as she entered the sick man's cabin the eyes that met hers, with a burning glance full of futile longing, chafing with impotence and desire, were those of the man whom she had known in another place as Richard Cathcart. She knew him at once—recognised him, moreover, as the sailor who had had so mesmeric an influence over her a few days before; and although the sight of him, weak and on the verge of dissolution as he undoubtedly was, brought a host of painful memories surging over her like a flood, she yet felt the marvellous compelling power of those strange eyes, and acknowledged to herself that indeed she had no choice but to be there.

'So you've come,' he said, his voice stronger than his evident weakness led her to expect. 'I wonder what made you.'

'I am sorry to see you so ill,' Muriel said, feeling somehow as if she meant it.

He moved his head with the old impatient gesture she remembered so well. 'I am dying,' he said; 'ought to have been dead by this, if only you'd have let me.'

'I!' said the girl in amazement. 'What can I have to do with it?'

Very dreadful it was to hear him try to laugh. 'Not much,' he cackled; 'but I expect I've got a conscience, or a bad pain somewhere, that makes me think so. Anyway, you and Sir Hugh between you almost made me feel a man again. You'll remember that. It was too late, though; and now I'm dying—pretty quick, too, so he says,' again with that curious upward jerk of the head. The effort exhausted him, and for some minutes he lay without speaking. When at last he revived, his story, which was a long one, fell from his lips in halting, if perfectly coherent, sentences.

He spoke of his first meeting with Hugo Somerville, then a mere lad, easily attracted by an older man with a good deal more knowledge of the world than he himself possessed. Gambling and racing led to the same fatal end, and before long Cathcart had introduced the young heir of Thorpe Somerville to Isaacs the Jew money-lender. Once in the toils, there was no escape. Hugo put his name to bill after bill, and his crowning folly was to sign his father's name to a cheque for a large amount. The cheque was never presented, and therefore not dishonoured; for Cathcart obtained immediate possession of it, and easily persuaded the unfortunate Hugo that it amounted to a forgery. Under the pressure put upon him from time to time, he consented to everything that Isaacs or his instrument Cathcart suggested. Having bled Hugo as far as possible, the pair of schemers arranged that Isaacs should finance Cathcart in order to enable him to lay siege to the heiress. Hugo in the meantime was kept in ignorance of their real intentions, yet compelled to furnish information when required, and to stand by in the guise of Cathcart's body-servant.

The whole plot was so cold-blooded, so audacious, that Muriel gasped as she listened. More than once the doctor looked across from his position behind the sick man to note the effect of his revelations. He need not have been alarmed. It seemed to Muriel as if that for which she had been waiting had at last arrived: here, at last, was the clue to the mystery she had so nearly broken her heart in trying to solve.

In spite of the terrorism of Cathcart's rule, Hugo sometimes broke away from his jailer, and it was on one of these occasions that he met his sister and frightened her by demanding her watch. Fortune certainly favoured Cathcart in the affair; but the young man had been recognised by the old collie Rory, and it was clear that no time was to be lost. Not that Cathcart had ever any intention of murdering Hugo: none of those instincts were his. His villainy was of that finer type which seeks, for base purposes, the mastery over men's minds, and recks little of their wretched bodies. Nevertheless, he wanted Hugo out of the way, and out of the way the miserable heir of the Somervilles had to go. Again fate played into Cathcart's hands. Chance brought him back from London earlier than he had intended on the day of Sir Hugh Somerville's death, and when, on his return to The Lodge, he found that Hugo was missing, he set out at once to look for him. Chance again led him to direct his steps towards the Fairy Pool, where, in the course of his search for the missing Hugo, he came upon the dead body of Sir Hugh Somerville. Evidently he had slipped on the soft edge of the pool, and as he fell his gun had gone off, killing him instantly. He was dead when Cathcart found him, but his body was still warm. It was in making this discovery that Cathcart's hands touched the pocket-book in the dead man's breast-pocket, which had proved his own undoing and the source of so much grief. He took it, partly on impulse, partly with the idea that it might contain something of use to him. As it happened, there was little of any value; and he burnt the papers immediately, but—perhaps with a view to further torture—omitted to burn the case itself, trusting

famous cities and sights were fraught with too much that was painful; so that, in the newness of her grief, to revisit them so soon would have seemed like sacrilege to Muriel. Anywhere else—so only that she might avoid the pangs of memory and leave, as far as was possible, thought behind her—she was willing to go; and a tour round the world suggested itself as the most hopeful means of securing a complete recovery for the shattered nerves and numbed faculties.

One bleak day in March a sad-faced young girl, wrapped in a heavy travelling-cloak, stood on the deck of the big liner *Kielder Castle*, watching the shores of her native land recede out of sight and ken. Now, after two years, Miss Fancourt was able to congratulate herself on the prospect of ultimate success. That good woman was herself no longer young, and to settle down to spend her small income and remaining years in doing quietly the good she could had been a dream from which she was loath to part. Yet she had never for one moment hesitated, never in her inmost heart complained; and now every day brought her reward appreciably nearer. The irreconcilable grief of the very young, the hopeless and unequal fighting against the mandates of a fate as cruel as it was inexorable, were gone, with happy childhood, for ever; but to Miss Fancourt's loving eyes her charge was daily ripening into a particularly charming woman. The shadow that still lingered in the violet eyes gave her an appearance of being older than her years; but she looked, and undoubtedly was, happy, taking a new and never-ceasing interest in the various aspects life wore in the countries through which they passed.

The winter season was spent at Simla, whither Harry Markham repaired as often as the authorities would permit him to do so. He and Muriel became fast friends; but beyond the lines of friendship Harry never ventured, and when the approach of the hot season necessitated a move being made by the two ladies, the establishment of a tolerably frequent correspondence was the only visible result of several months of pleasant intercourse. The next point was Japan; and although Muriel thoroughly appreciated the charms of that delightful country, it is not to be denied that she missed Harry as a companion and cicerone. And perhaps the girl was not entirely sorry when a letter reached Miss Fancourt from a brother long settled in Vancouver, inviting that lady and her charge to pay him a visit of some months' duration. The invitation was accepted, and Muriel sat bidding good-bye to Japan and its cherry-blossom with a great deal more regret than she had felt on leaving her native land. Yet she was beginning to admit that damp, misty England had charms of its own, and also that poor Thorpe Somerville had claims. In rather less than a year she would be twenty-one, and a person with responsibilities and duties; also, in just about a year Harry's long leave would again be due, and it would make a difference to her home-coming—exactly how much she did not bring herself to define—if he were there to welcome or be welcomed.

As she sat thinking, all at once she felt the uncanny sensation of some one watching her very intently, and looked up, half-expecting to see Miss Fancourt coming towards her. As she sat thinking, all at once she felt the uncanny sensation of some one watching her very intently, and looked up, half-expecting to see Miss Fancourt coming towards her. That lady, however, was not in sight, nor was any one near; but as she lifted her head, her eyes, drawn by some mesmeric attraction, fell on a sailor at a little distance who was engaged in cleaning some of the ship's brasses. He looked away immediately, and Muriel settled herself once more; but in less than five minutes the same thing happened again. This time she rose and walked towards a group of people who were just then coming on deck, first giving a searching glance at the man who had had so strange an influence over her. The impression she carried away with her was of lithe, sinuous grace, common enough in Lascar crews; yet this man was no Lascar—of that she felt perfectly convinced. As she joined in the laughter and gay chatter of some of the younger passengers the uncomfortable sensation faded; but in a few days it was recalled to Muriel's mind in rather a sinister manner by the young ship's doctor, who came to her preferring a singular request. It appeared that one of the crew, an Englishman, was down with fever; the attack was an exceptionally severe one, and there were grave doubts of the man's recovery.

'Practically,' said the young doctor, 'he is a dead man at this moment; but his mind is so alert, his faculties so acute, his will so strong, that they dominate the physical part of him. He won't die, he declares'—and the young man laughed nervously—'until he's seen *you*.'

'Seen me!' exclaimed Muriel in astonishment. 'What can he possibly want with me? He must be raving!'

'He has been,' the doctor admitted; 'but he's sane enough now. At all events, he's so weak that he's perfectly safe. He's a most curious chap,' he continued, almost as if he could not help himself. 'He's got a wonderful kind of mesmeric force, ill as he is. And he's what's called a gentleman—or was once.'

'He has mesmerised you, I think,' Muriel said, smiling. 'You have not yet told me what it is that he wants with me.'

'Well, to tell you the truth, I hardly know myself,' the young man responded. 'He asked me to be certain to tell you that you would repent it all your life if you did not spare him the few minutes he wishes for. He can't speak for any length of time, his weakness is too appalling. Any other man would have died twelve hours ago.'

Muriel gazed beyond the man at her side over the shining expanse of water, in which was reflected a sky of cloudless blue. Little ripples

chased each other over the calm surface, each flecked with gold in the dazzling sunlight. What a day to die! Suddenly she turned to the young man, deep compassion in her eyes. 'I must see him,' she said, 'even if it is only for the sake of a dying man's whim. It may be that I remind him, so far away, of some one at home.'

Without another word, the doctor rose and offered his hand to help her from her deck-chair. 'It must be at once, if it is to be at all, for more reasons than one,' he explained. 'I don't give him more than the day. I think you're an angel. I expect I shall be sacked for this,' he went on irrelevantly, 'the minute we touch land, if the skipper comes to hear of it.'

'I expect you will,' thought Muriel, smiling faintly, and then straightway alike forgot the boyish young doctor and her own nervous qualms; for as she entered the sick man's cabin the eyes that met hers, with a burning glance full of futile longing, chafing with impotence and desire, were those of the man whom she had known in another place as Richard Cathcart. She knew him at once—recognised him, moreover, as the sailor who had had so mesmeric an influence over her a few days before; and although the sight of him, weak and on the verge of dissolution as he undoubtedly was, brought a host of painful memories surging over her like a flood, she yet felt the marvellous compelling power of those strange eyes, and acknowledged to herself that indeed she had no choice but to be there.

'So you've come,' he said, his voice stronger than his evident weakness led her to expect. 'I wonder what made you.'

'I am sorry to see you so ill,' Muriel said, feeling somehow as if she meant it.

He moved his head with the old impatient gesture she remembered so well. 'I am dying,' he said; 'ought to have been dead by this, if only you'd have let me.'

'I!' said the girl in amazement. 'What can I have to do with it?'

Very dreadful it was to hear him try to laugh. 'Not much,' he cackled; 'but I expect I've got a conscience, or a bad pain somewhere, that makes me think so. Anyway, you and Sir Hugh between you almost made me feel a man again. You'll remember that. It was too late, though; and now I'm dying—pretty quick, too, so he says,' again with that curious upward jerk of the head. The effort exhausted him, and for some minutes he lay without speaking. When at last he revived, his story, which was a long one, fell from his lips in halting, if perfectly coherent, sentences.

He spoke of his first meeting with Hugo Somerville, then a mere lad, easily attracted by an older man with a good deal more knowledge of the world than he himself possessed. Gambling and racing led to the same fatal end, and before long Cathcart had introduced the young heir of Thorpe Somerville to Isaacs the Jew money-lender. Once in the toils, there was no escape. Hugo put his name to bill after bill, and his crowning folly was to sign his father's name to a cheque for a large amount. The cheque was never presented, and therefore not dishonoured; for Cathcart obtained immediate possession of it, and easily persuaded the unfortunate Hugo that it amounted to a forgery. Under the pressure put upon him from time to time, he consented to everything that Isaacs or his instrument Cathcart suggested. Having bled Hugo as far as possible, the pair of schemers arranged that Isaacs should finance Cathcart in order to enable him to lay siege to the heiress. Hugo in the meantime was kept in ignorance of their real intentions, yet compelled to furnish information when required, and to stand by in the guise of Cathcart's body-servant.

The whole plot was so cold-blooded, so audacious, that Muriel gasped as she listened. More than once the doctor looked across from his position behind the sick man to note the effect of his revelations. He need not have been alarmed. It seemed to Muriel as if that for which she had been waiting had at last arrived: here, at last, was the clue to the mystery she had so nearly broken her heart in trying to solve.

In spite of the terrorism of Cathcart's rule, Hugo sometimes broke away from his jailer, and it was on one of these occasions that he met his sister and frightened her by demanding her watch. Fortune certainly favoured Cathcart in the affair; but the young man had been recognised by the old collie Rory, and it was clear that no time was to be lost. Not that Cathcart had ever any intention of murdering Hugo: none of those instincts were his. His villainy was of that finer type which seeks, for base purposes, the mastery over men's minds, and recks little of their wretched bodies. Nevertheless, he wanted Hugo out of the way, and out of the way the miserable heir of the Somervilles had to go. Again fate played into Cathcart's hands. Chance brought him back from London earlier than he had intended on the day of Sir Hugh Somerville's death, and when, on his return to The Lodge, he found that Hugo was missing, he set out at once to look for him. Chance again led him to direct his steps towards the Fairy Pool, where, in the course of his search for the missing Hugo, he came upon the dead body of Sir Hugh Somerville. Evidently he had slipped on the soft edge of the pool, and as he fell his gun had gone off, killing him instantly. He was dead when Cathcart found him, but his body was still warm. It was in making this discovery that Cathcart's hands touched the pocket-book in the dead man's breast-pocket, which had proved his own undoing and the source of so much grief. He took it, partly on impulse, partly with the idea that it might contain something of use to him. As it happened, there was little of any value; and he burnt the papers immediately, but—perhaps with a view to further torture—omitted to burn the case itself, trusting

to Hugo's lack of initiative for its safe keeping in his desk. For once, he reckoned without his host: Hugo, in a kind of frenzy, broke open the desk, found the pocket-book, and accused Cathcart of the murder. This gave the older man the opportunity he sought. Cathcart's threat was all that was needed to send the poor weakling, mad with fear, to the death that came upon him so swiftly and so suddenly.

Perhaps for once Cathcart's nerve deserted him when he came to himself in his study at The Lodge and found Hugo gone, and with him the incriminating pocket-book. In any case, he felt, as he expressed it, that the game was up. Of his subsequent adventures he said nothing; the inference was a fair one, that luck had not run his way. Had death not intervened, his turn might have come round to him again; for, feeble as he was, the old compelling force still remained, and to neither of his hearers, either then or at any other time, did it occur to doubt the truth of his story.

With the end there came no prayers for forgiveness, no excuses. Cathcart—'though that 's not my name, you know'—lay back with something like a sigh of relief as the last words fell from his lips: 'Put me to by-by, old chap,' he said to the young doctor. 'I 'm worn out.'

He closed his eyes; and at a sign from the doctor Muriel crept from the cabin.

That night Cathcart's restless spirit departed, and the long-backed ocean-rollers coursed over the still depths where his body found its last repose.

CHAPTER VIII.

IT was Christmas-time, and Muriel, now of age and her own mistress, sat in the pretty drawing-room of her friend Madge's sunny little house in South Kensington. During Muriel's long absence abroad Madge had met and married Stanley Craven, a young barrister not too heavily blessed with this world's goods, but with brains, and already not entirely briefless. The event took place when Muriel was in Vancouver; but on her return to England in late November, Madge, although still in the seventh heaven, at once invited her friend to spend Christmas with her. Muriel accepted gratefully, while Miss Fancourt seized the opportunity of visiting her parson-brother in the poor Lancashire parish which held for her all the interests she could spare from her darling Muriel. And so it happened that on Christmas Eve the heiress of Thorpe Somerville, alone in the half-light, felt, if the truth were told, a little lonely. Madge, after dispensing tea, had slipped away to sit with Stanley in his study until dressing-time. A band was playing carols outside, and a hint of frost in the air made the fire glow brightly. After all, no place was like England at Christmas, and it was pleasant to be there once more. How far this contentment with circumstances not wholly satisfactory was due to the fact that Harry Markham, whose regiment was now quartered at Aldershot, was presently expected to dine and sleep need not be analysed, though something may be assumed. As for Harry, his devotion was as deep as ever, if less obvious: sufficient for him that his love's violet eyes shone with a new radiance, and that she should talk with him on subjects small and great with confidence in his never-failing interest, and yet with a hint of shyness in her frankness that to his lover's intuition spelt hope and new life. He knew that if he were lucky enough to win her, he would gain more than the charming, light-hearted child of his earlier fancy; his girl-love was grown a woman, tender, deep-hearted, whose character was refined and ennobled by the furnace of pain through which she had passed. Something of this was in his mind as he drove up to the Cravens' house. He entered the drawing-room unannounced, and as the door opened Muriel rose from a low seat where she sat in the firelight and came towards him with a glad little cry.

'Harry! How nice of you to come so early! I was just wondering if I felt lonely.'

The words that rushed to Markham's lips were sternly repressed. 'Do you like sitting in the dark?' was all he said.

'I call this the "talking light,"' replied the girl. 'It is a very good name, don't you think?'

The young man assented rather absently; and Muriel stirred the glowing embers until they burst into a bright blaze, the red flames lighting up her hair and charming face.

'So you were feeling lonely?' Markham asked as he watched her.

'I believe I was, just a teeny-weeny bit; and Madge has only this minute left me. She is everything that is kind and good.'

His next words surprised her. 'Do you remember once telling me that part of you was dead? I suppose you really meant that you had lost the power to feel?'

'Yes,' replied the girl frankly, although she was conscious of avoiding his earnest gaze; 'I was only a child, and the shock of that dreadful time numbed me. But that is all over now. Since that last talk with Mr Cathcart everything has seemed different. The hurt is there, but without the fear.'

The two had often spoken of Cathcart's confession. Indeed, Muriel looked upon it as his atonement; and even Markham, who was more sceptical, felt that he must give it credence, and the dead man the benefit of every doubt. At all events, Muriel's attitude took the sting out of Cathcart's memory as far as Markham was concerned; he felt, now, little save a great pity and regret for a life so wasted, so abused.

'Poor chap!' he said reflectively—'Cathcart, I mean.'

'Do you know, that is my feeling,' Muriel agreed. 'He did poor Hugo to death as surely as if he had really killed him, and I think perhaps that troubled him at the end. I like to think, too, that he was sorry for having treated us all so badly. Hugo might have been here now if he had never known Mr Cathcart.'

'He's paid his reckoning,' Harry said.

'Yes; and I can forgive him,' said Muriel. 'I understand now how there are some things in life for which death is the only cure. You don't think of that all at once.'

'No,' agreed Harry. 'But if it's peace to the dead, what are you going to do for the living?'

All he could see was the outline of her cheek in the firelight as she asked very softly, 'What does the living want?'

'You!'

For one moment she lifted her downcast eyes and looked at her lover; the next she was in his arms, her head pillowed on the heart that had loved her so long and so faithfully.

'Oh, I love you!' murmured the girl with a long sigh of utter happiness.

'When did you find that out?' Harry inquired tenderly.

'As soon as you weren't there,' Muriel confessed with a contented little laugh. 'Honestly, I believe I missed you dreadfully long before we got to Japan. I didn't know quite as soon as that, though.'

'I've known always,' Harry said. 'After all, whatever we have to go through, only one thing really matters in the end, and life's a fine thing if you get it.'

'I know what you mean,' Muriel whispered, a soft radiance shining in her lovely eyes. 'Come bad times or come good, the best of all is love.'

'Yes,' Harry echoed, 'love is best.'

THE END.

THE SWORDS OF THE SUDAN.

AMONG the trophies of arms displayed on the walls of Windsor Castle, one of the most interesting of the long series is a group of weapons and armour sent to Queen Victoria by Lord Kitchener after the Dongola campaign on the Upper Nile in 1896. The trophy consists of a coat of chain-mail, a number of spears, and a long cross-hilted sword. On the straight steel blade of the sword there is an inscription in old-fashioned letters: '*No me saques sin razon. No me entraines sin honor.*' The words are Spanish, but the same motto was inscribed on sword-blades in the days of chivalry in most of the languages of Europe. Its meaning is the knightly rule for all who bear the sword: Do not draw me without reason. Do not sheath me without honour. The weapon was taken from the abandoned camp of Wad Bishara, the Dervish general, after the battle of Hafir (September 23, 1896). How came a blade with such a motto to be found in a Moslem bivouac in the heart of the Sudan?

Even without the inscription, the very shape of the sword at once suggests that it is no Eastern weapon. But swords of the same kind are, with the broad-bladed spear, the typical arms of the Sudanese tribes. All who served in the Upper Nile campaigns saw scores of these heavy, straight-bladed, cross-hilted swords carried both by the enemy and by friendly Arab tribesmen. There is nothing Eastern about them except the curiously worked red-leather scabbard. Blade and hilt are both medieval and European in pattern—the blade long, straight, heavy, double-edged, and sharp-pointed; the hilt cross-shaped, with a round iron pommel, and two pieces of springy steel passing downwards from the guard to grip the scabbard. The curved scimitar of the East is an utterly different weapon. The straight Sudan sword belongs to the days of armour. It is badly balanced, and not made for the game of cut and guard and quickly changing thrust that came into fashion later on, when fencing was invented, and a light, deftly handled blade served both as sword and shield. This long, heavy, somewhat clumsy weapon is the older kind of sword, meant for mere downright hacking and smashing through helmet and hauberk, in the days when men rode into battle sheathed in complete armour, and with the barred visor lowered over the face. If one compares it with the swords of crusading days in our museums, the likeness of pattern strikes even the least observant.

The blade at Windsor, with its Spanish inscription, is probably a Crusader's sword centuries old. There are others of the kind. An officer in the same Dongola campaign tried in vain to persuade a friendly Arab to sell him his sword. Running down the blade from hilt to point there was a French inscription, of which he could only decipher a few words, because the Gothic letters were nearly obliterated by a later inscription in Arabic, probably a verse of the Koran. The flowing curves of the Arabic letters had been cut into the steel with a graver, and the hollows thus made had been filled with gold wire, and the whole then polished to an even surface. This must have been a captured Crusader's sword. One cannot be sure about blades that have no inscription. Many of them are doubtless the work of native armourers of later times, modelled on the older weapons.

The presence of these Crusader swords in the Sudan is not so difficult to explain. In the thirteenth century the Mohammedan caliphs of Egypt not only carried on successful wars against the Crusaders in Syria, destroying the last vestiges of the Latin kingdom of Jerusalem, but also defeated two attempts of the Europeans to invade Egypt itself, one of them led by St Louis of France. Enormous quantities of Western arms and war-like equipments must have thus passed into the possession of the Mohammedan conquerors. Now, it was also about the end of the thirteenth century —that is, just after the long struggle with the Crusaders came to an end—that the Mohammedan conquest of the Sudan countries, south of the Second Cataract of the Nile, began. Till then Dongola had been a Christian kingdom, though long cut off from all communication with the rest of Christendom. It is likely that the large available supply of the arms and armour of western Europe would be used to equip these expeditions to the Upper Nile, and thus these Crusader swords found their way into the Sudan.

But they were not the only reminders of crusading days to be seen in the Arab and Dervish camps of the Upper Nile. The saddle of an emir's war-horse looked strangely like that used by the Western knights of the thirteenth century. The *marteau-de-fer*, a heavy mace used for crushing the helmet of an adversary, was sometimes to be seen hanging at the saddle-bow of a sheikh. The shaft was often covered with crocodile hide, with a cushion of hyena-fur where the hand gripped it, but the iron head was unmistakably Western in pattern.

But it was not only on the Upper Nile and among the wild warriors of the Sudan that one found reminders of the ill-fated expeditions of the Crusaders to Egypt. At the large town of Tantah, in Lower Egypt, there is an annual fair, one of the most important gatherings of the kind in the whole country. I do not know if the observance which I am about to describe is still kept up, for I have not been in Egypt for some years; but twelve years ago a torchlight procession, known as 'the Triumph of the Caliph,' was one of the features of the fair. First came men beating drums and waving green banners, then a guard of spearmen, and then, surrounded by a group of horsemen representing his emirs, rode a man richly dressed to personate one of the victorious caliphs of the thirteenth century, perhaps El Kamil, or, it may be, Es Saleh, the conqueror of St Louis. Before the caliph's horse half-a-dozen captives were led in chains. They wore European armour, plate, and mail, with visored helmets, through the bars of which one saw, not the bronzed faces of Western knights, but the yellowish-brown features of the fellahin acting the part of the conquered Crusaders. It is quite possible the armour dated from crusading days, repaired, it may be, from time to time, but not mere counterfeit work. Europeans as a rule kept away from the procession, which was a somewhat unpleasant reminder of the time when a Moslem ruler of Cairo had among his prisoners so many of the princes and warriors of western Europe.

THE MAKERS OF 'PUNCH.'

By Toby, M.P.

THE first number of *Punch* appeared on 17th July 1841. Fifty years later I was privileged to sit at the table in the Ship Hotel, Greenwich, on which was spread the Jubilee Banquet. It was not strange, since Time is inexorable, but it was nevertheless sad, to reflect that of the band gathered round Mark Lemon on the birthday of *Punch* not one lived to see the revered Master's jubilee. The ravages of time are even more sharply marked by the fact that of the members of the *Punch* staff who now meet at the weekly dinner only one formed part of the company when, twenty-four years ago, I joined the little band. This is Linley Sambourne, who seems to grow younger as the years revolve, and whose touch, as the weekly cartoon testifies, is as sure and as delicate as at any earlier period of his connection with the paper.

Punch started on the co-operative plan, its founders having more brains than money. Though Mark Lemon, corporeally and by length of association, was popularly recognised as the first editor, there were actually three co-editors, the other two being Horace Mayhew and Sterling Coyne. Likewise, there were no less than five illustrated front pages before there dawned on the pleased public the one to-day familiar in every English household throughout the world. This, as every one knows, was drawn by Dicky Doyle, and made its first appearance in January 1849.

It is a tradition of the *Punch* Table that Mark Lemon began his editorship on a salary of three hundred pounds a year, and finished it at a rate of one thousand five hundred pounds, a sum at the date regarded among journalists as what Sala, speaking of his own salary, described as the wages of an ambassador. In the first year of his career there came some anxious moments for Mr Punch. The paper had a good start, and was going on fairly. Within two months affairs became critical. There was a more lavish supply of editors than of capital. The printer, who had to pay his men whatever befell, grew restless, finally declining to carry on. It was at this stage that the firm of Bradbury, Evans, and Co. came to the rescue, undertook the printing

and publishing of *Punch*, and have been associated with its bounding good fortune ever since.

Shirley Brooks succeeded Mark Lemon in the editorial chair. Practically he had filled it for some time. Amongst other developments, he—having had experience of the Press Gallery of the House of Commons in the service of the *Morning Chronicle*—introduced a new feature in the 'Essence of Parliament,' written by himself. To him succeeded Tom Taylor. In 1880 Sir Francis Burnand, then plain Frank, was by acclaim nominated to the editorship, a position he filled with conspicuous advantage to the paper for a period exceeding a quarter of a century. Of the present *Punch* staff, all the members, with the exception of Linley Sambourne, were called to the Table under his editorship.

Prominent among the Makers of *Punch* on the artistic side were Leech and Doyle. Each was in his way incomparable. When they withdrew from the Table—one carried off by the hand of death, the other retiring affronted by attacks upon the head of his religious faith—it seemed that the gaiety of subscribers to *Punch* was eclipsed. Leech and Doyle still stand apart, unapproachable in their especial line. But somehow or other—and this is one of the secrets of the prolonged success of the paper—one always comes along and fills the empty place. Truly there were giants in those days. When they passed away there came in succession Tenniel, Keene, Du Maurier, Linley Sambourne, Bernard Partridge, and Raven Hill, who each in distinct manner maintained the renown of *Punch*. Leech and Doyle were before my time. With the rest in the brilliant list I have had the pleasure, extended over many years, of dining and working.

It chanced that when I joined the Table my allotted seat was next to Charles Keene, then in regular weekly attendance. He did not contribute habitually to the bubble of fun and good-humour that marked the dinner-hour. On rare occasions he was induced to tell a story about a Bakewell pudding, the unconscious point of which was that no listener quite recognised it. Charles Keene's enjoyment was contagious. When his face wrinkled in laughter the Table sympathetically roared, though if any seated at it had been asked to give an account of the cause of his merriment he would have been in a position of difficulty. Amongst other peculiarities, Keene habitually smoked small clay-pipes vaguely understood to have been found in excavations in the neighbourhood of London Wall. By curious coincidence they were in pattern and size much like those used by the Japanese, though the latter are of metal.

At home and abroad, perhaps most enthusiastically in France, Keene was recognised as the master of drawing in black-and-white. Some years later he found a worthy successor in Phil May, whose delightful drawings for all too brief a time illuminated the pages of *Punch*. May was as rapid in the execution of his work as he was happy in its design, peerless in its production. A favourite habit with him whilst the cartoon was being discussed was to turn over a menu-card and draw on its back some fanciful design suggested by the current of conversation.

Du Maurier was a delightful companion at the dinner-table, as indeed he was elsewhere. He took little part in the discussion of the cartoon, which, chiefly concerned with politics, was outside his range. But when the work was done—and work is the *raison d'être* of the weekly *Punch* dinner—Du Maurier, smoking unnumbered cigarettes, used to sparkle. The natural limits of a *causerie* of this kind preclude reference to colleagues still seated round 'the old mahogany-tree,' or indeed to those who, voluntarily withdrawn from the scene, are still with us. One must, therefore, be content with a passing tribute to Sir John Tenniel, whose name is a cherished household word wherever the English language is spoken.

Of the Makers of *Punch* in the literary wing of the brotherhood the name of Thackeray stands out prominently. He began to contribute in *Punch's* second year. The start was not auspicious, and for a while threatened a final parting. He began a series of papers entitled 'Miss Tickletoby's Lectures on English History.' They fell flat, and the publishers, enclosing a modest cheque, intimated that they did not care to have any more. Thackeray survived the rebuff, and soon came to be one of the most voluminous and most prized among contributors. He worked both with pen and pencil, having in this connection, as in the wider field of fiction, an appreciative fancy for himself as an artist. It is an old story that one of his earliest ambitions was to illustrate Dickens's books. 'The Book of Snobs' ran through a full twelve months, and made a great hit. Another success was the 'Diary of Mr Yellowplush,' and also the lucubrations of Policeman X. Other literary contributions that helped to the making of *Punch*, and live through the ages, are Douglas Jerrold's 'Caudle Lectures,' Hood's 'Song of the Shirt,' and Burnand's 'Happy Thoughts.'

The early *Punch* dinners were at the outset Bohemian alike in character and surroundings. They were held at various hostelries in the neighbourhood of Fleet Street, and were, I imagine, paid for out of the pockets of the guests. When prosperity shone it came to pass that the proprietors became the hosts, a special room being set apart in the offices for serving the banquet. The satirists, shooting Folly as it flew through the week, did not always spare each other. Douglas Jerrold, in particular, had a sharp tongue which did not spare his colleagues. He did not love Thackeray, at whom he occasionally girded. Thackeray's broken nose and the story thereto pertaining are familiar to every one. It was a kind of infirmity that would have been held sacred by men of delicate feeling. For Douglas Jerrold it had a morbid attraction.

Mr Spielmann, the historian of *Punch*, has rescued from past records two stories illustrative of Jer-

rold's humour. One tells how, Thackeray having applauded Dicky Doyle's action in retiring from the staff on account of attacks on the Pope, some one said, 'Thackeray's turning Roman.' 'He'd best begin with his nose,' snapped Douglas Jerrold. On another occasion, coming in late to dinner, Thackeray explained he had been at the christening of a friend's child. 'Good lord, Thackeray!' exclaimed the genial Jerrold, 'I hope you didn't present the child with your own mug.'

We heritors of the legacy bequeathed by the Makers of *Punch* never say rude things like that under the mahogany-tree of which Thackeray sang:

Here let us sport,
Boys, as we sit;
Laughter and wit
Flashing so free.
Life is but short;
When we are gone
Let them sing on
Round the old tree.

THE MONTH: SCIENCE AND ARTS.

PROFITABLE DISPOSAL OF SEWAGE-SLUDGE.

ONE of the most perplexing problems confronting municipal and rural authorities to-day is the disposal of the sludge or sediment of sewage. When it is recollected that in a town of fifty thousand inhabitants the accumulation of this material is about fifteen tons per day, some idea of the difficulty involved may be realised. This sludge is the heavier particles contained in the water—aggregating about 10 per cent. of the total bulk—which collects in the settling-tanks; and the general means of disposal is either dumping on agricultural land—a process involving heavy expense in cartage—or destruction by combustion in dust-destructors. The first method, while of certain economic value from the fertilising point of view, is decidedly prejudicial to health, and cannot be carried out in the vicinity of large towns; while the second, though effective, is certainly wasteful. The question has been how to utilise this residue to the most advantageous extent in accordance with hygienic principles. The task has been frequently essayed, but the inherent difficulties have been so many as to prevent a commercially practicable solution being obtained. The general trend of these experiments has been in connection with artificial manures; but, unfortunately, the possibilities in this direction are somewhat nullified by the large proportion of fatty substances present in the sludge, which have the tendency to clog up the soil. This heavy proportion of grease is attributable to the huge quantity of soap consumed in these islands, aggregating something like four hundred thousand tons per annum, the greater part of which finds its way into the sewers. A well-known English doctor has, however, recently evolved a cheap and simple means of dealing with this sludge, whereby it is turned from a useless substance into a valuable commodity, and the successful experiments that have been made therewith by a north of England municipality have conclusively demonstrated that it not only completely overcomes the disposal difficulty, but its operation can be carried out profitably, so that a new source of revenue is open to our governing bodies. He takes the sediment which accrues in the settling-tanks, drives out the superfluous water in a press, and distils the resultant product—to which some cheap chemicals of a certain character are added—in a patent retort. Here, under the action of superheated steam, the fatty ingredients are first driven off, the oil being subsequently regained in a tower, where, under the cooling effects of jets of cold water, the fat is deposited in the form of thin white flakes like snow. The elimination of the grease and remaining water in the still leaves a brownish powder of the consistency of flour, and perfectly odourless. Seeing that this residue contains nitrogen equal to 2 per cent. of ammonia, and about 2 per cent. each of phosphoric acid and potash, it is evident that with the addition of a little phosphate it would constitute a rich and valuable artificial fertiliser. Its prime value, however, rests in the fact that it is composed of some 40 per cent. of decomposed organic matter, which renders it of great use for the enrichment of impoverished or poor soils. It is found that one ton of sediment after subjection to preliminary pressing yields one hundredweight of grease, worth from seven pounds ten shillings to ten pounds per ton; while the fertiliser, averaging about eight hundredweight per ton of sludge in its raw condition, is found to command a price of about six shillings per ton. The cost of treating a ton of pressed sludge is about five shillings, while the total realisable value of its product is approximately nine shillings, leaving a margin of four shillings per ton. In the case of large towns the system would not only be found the most hygienic solution of a complex problem, but at the same time would prove highly lucrative, especially if the manurial residue were combined with a little phosphate on the spot, which would enable it to fetch about twenty-five shillings per ton, sold direct to the farmer.

A NON-INFLAMMABLE CELLULOID.

Repeated attempts have been made to render celluloid non-inflammable, but to no purpose, for the simple reason that its component parts are among the most combustible substances known. Therefore, it is evident that any fireproof celluloid, while retaining all the properties of the latter, must

be a combination of non-combustible ingredients. The precise characters of such constituents have been ascertained by a London chemist, and so successful is the imitation that it is impossible to distinguish the special from the ordinary celluloid except by ignition. Whereas the former instantly ignites with an explosive flame, the latter declines to burn at all. The new product, which can be used for any purpose to which celluloid is applied, is indeed preferable to the latter for many reasons, owing to the elimination of other defects inherent to the original article. It is well known that celluloid when immersed in water in a short time becomes saturated and soft, rendering it difficult to handle, as every film-photographic enthusiast realises to his cost. The non-inflammable article may be maintained in water for any length of time without impairing its original character, for it is perfectly waterproof. In its transparent form it should have a great future in photographic circles, for which, as tests have shown, it is eminently adapted. It can be used in the thinnest sheets, such as for roll-films, and by its use the many dangers attending kinematographic projection are overcome. Films made thereof will not buckle, blister, or split under the application of intense heat. It is equally applicable for the manufacture of the thousand and one articles for which celluloid, despite its dangerous character, is now used. Unlike the latter, it is not brittle, and can be more roughly used or bent without fear of breakage. Its most commendatory feature, apart from the commercial point of view, is that it can be produced at a far lower cost than the ordinary article, the difference being from about 40 to 60 per cent., owing to the fact that the ingredients employed are cheaply obtainable in unlimited quantities.

BUTTER-PACKING IN STRAW BOXES.

An economical development in the Queensland dairy industry has been effected by the perfection of a process for the manufacture out of straw of the boxes in which the butter is packed for shipment. Hitherto such boxes have been made of pine-wood; but owing to the extensive expansion of the butter-export trade, and a coincident heavy demand for the necessary wood (the forests of which are being rapidly depleted), the latter has reached a prohibitive figure. Over three million boxes, representing a cost of something like two hundred thousand pounds, are now used every year in Australia in this trade alone. The new box, which only costs a few pence, is made of straw and kaolin, and by its use farmers, it is estimated, will effect a saving of nearly fifty thousand pounds per annum. The box is strong, odourless, and damp-proof, and compares very favourably in weight with the wooden article.

ELECTRIC BRUSHES FOR CLEANING SHIPS.

An invention which should be of signal service to shipping companies has recently been perfected, the object of which is the cleaning of the submerged portions of a ship's hull while afloat, so that the necessity of going into dry-dock, with its attendant heavy cost and expenditure of time, is avoided. At the same time it enables the vessel to be kept in the pink of condition so far as her speed-capacity is concerned, and the use of anti-fouling compositions can be dispensed with. The scrubber comprises an arrangement of hogging-brushes disposed on a mat of battens in such a way that they are used against the lie of the bristles, thus flicking off the accumulated deleterious matter in advance of their progress. These battens are fitted at either end with powerful electric magnets, which, when the scrubber is in use, cause it to cling tenaciously to the side of the ship, so that there is no possibility of the brushes riding over the harder accumulations of marine growth. The mat is worked over the hull by means of cables passing round the ship and actuated by the ship's winches. The magnets, which have an aggregate gripping-power of over one ton, ensure its constant pressure against the hull, so that the full cleaning-power of the brushes is effected under all conditions. The great advantage of this system is that it enables a vessel to be cleaned while moored alongside the quay, loading or unloading, expeditiously, efficiently, and cheaply. A first-class battleship can be scrubbed in twelve hours, and a four-thousand-tonner in about eight hours, at an inclusive cost of about twenty pounds. The system is in operation upon the Clyde with great success, boot-topping the fast pleasure-craft plying on the river. The sides of these ships for about five feet below water foul so quickly that they require cleaning three times as often as the bottoms and bilges. Formerly the custom was to lay the ships ashore for a tide for cleaning purposes. Now they are electrically cleaned while afloat, in an hour, at a cost of five pounds. The maintenance of one or two of these appliances in every harbour, especially in some tropical seas where fouling is very rapid, would do much to enhance the attractiveness of the ports to the shipping community, who are often compelled to wait a very long time before a favourable opportunity arrives to enable the hull to undergo the much-needed cleaning.

BULB-CULTURE IN ENGLAND.

Shipping bulbs from England for cultivation in Holland is akin to sending coals to Newcastle. Yet an increasing yearly trade is being done in this connection; in fact, English bulbs are achieving a world-wide reputation. The centre of this industry is Wisbech, where the Bath floral farms cover some ninety acres, of which all but ten acres are devoted to the raising of narcissus. This is the largest bulb-farm in the country, and some very exquisite varieties have been produced here, for which a heavy demand has arisen not only in this country but in Holland. The superiorities of the English article are that the bulbs are much harder

and heavier than the Dutch, and are more prolific in their yield of flowers when forced—the supreme test in bulb-culture. Only the 'planting sizes' are despatched to Holland, and some idea of the proportions of this export trade may be gathered from the fact that in a single month recently no less than fourteen and a half tons of narcissus bulbs were sent across the North Sea for cultivation. Upon this farm, when the bulbs are being lifted, about one hundred and fifty women are engaged in cleaning them; while planting gives employment to about ninety men and women per field. The results attained in the Wisbech district have conclusively demonstrated the fact that this country can easily compete with Holland in the culture of bulbs if the industry is only carried out upon scientific and well-organised lines such as prevail upon the Bath farms. There is no doubt that if the problem were seriously tackled this country could be made the largest bulb-producing country in the world. Certainly, the culture would do much to solve the problem of 'back to the land.' At the Bath farms alone the annual wages-bill is no inconsiderable item, a fact which attracted the attention of a Royal Commission. Fortunately the superiority of the English bulb is rapidly being recognised at home, and many thousands of orders which formerly went to Holland are now being diverted to native growers, since the prices for the two kinds of produce are practically the same, notwithstanding the apparently cheaper conditions under which the Dutch bulbs are raised.

A HANDY SACK-HOLDER.

Those who have to despatch their produce in sacks, especially millers, lime-burners, and so forth, readily realise the difficulties attending the charging of the bags. One man or boy has to be deputed to hold the mouth of the sack open while it is being filled. An ingenious means of overcoming this difficulty has been effected by an engineer attached to one of our large gasworks, where the uneconomical labour-conditions attending the prevailing system were recognised, and caused him to devise a highly efficient and simple mechanical holder. It comprises a small stand, upon which is mounted an upright pillar. Upon this pillar slides a collar carrying a lever. The longer end of the lever serves as the handle, and the shorter length the sack-holder. The bag is held in the distended position by two rings hinged together. The sack is placed through the lower ring and the mouth pressed over the rim all round. The upper ring is then lowered, and by means of a series of short spikes which pierce the sacking and pass through holes in the lower ring when it is pressed down the bag is held wide open. When the bag is filled the upper ring is simply swung back and the mouth of the sack left free for tying or sewing up. The apparatus is strongly made, is inexpensive, and easily operated, while it can be adjusted to handle any capacity of sack.

HOW TO SECURE AN OPEN-AIR BEDROOM.

While the reinvigorating and physical-building properties of fresh air during sleep are realised, in a variable climate like ours recourse to such methods is apt to result in the remedy proving worse than the disease. The window may be left widely extended, and the fresh air derived therefrom is undoubtedly beneficial; but its value is sadly nullified by the counter-draughts from other parts of the room. If one could only secure the inward stream of pure air through the window no harm would be done. By a recent ingenious contrivance, however, all the advantages of sleeping in the open air without any of the attendant discomforts are rendered safely available. This is a novel window-tent. The bed is drawn up to the window which is opened. Fitting within the space thus available is the mouth of a tent. This extends over the top of the pillow and down the side of the bed and back to the window again over the chest, with of course the upper or top side similarly covered. The head thus reposes exposed to the open air, the remainder of the body being within the room. The tent is made of an impermeable material which is light in weight, so that no inconvenience from this source is experienced, and as it fits closely to the bedclothes no draughts are experienced. In this way the body, being kept warm, uses its full energy to rebuild frame and brain tissue in conjunction with the inhalation of the pure, crisp, outer air. The contrivance, which should prove of distinct value to those suffering from consumption, catarrhal trouble, debilitating or nervous diseases, is inexpensive, and can be instantly set up when desired.

THE FOOD-VALUE OF PEAS.

It is a somewhat regrettable circumstance that the pea, which is one of the most nutritious articles of food, does not meet with a greater measure of popularity. From the proteid standpoint it is much superior to oatmeal, being some 80 per cent. richer in this substance than the latter, with a high percentage of carbohydrates and a small proportion of water. In fact, the pea is an ideal edible, since it possesses practically the whole of the constituents in correct proportions for the building up of animal tissue. No doubt during the summer season peas are extensively eaten, though it is to be feared they are regarded more as a tasty pseudo-epicurean dish than as a staple article of food. But it is during the winter that their advantages can be more strikingly secured. During the past few years inventive effort has succeeded in devising satisfactory means of preserving the results of summer cultivation in an appetising form without any recourse to pernicious colouring or preservative mediums. Formerly, out-of-season peas were either stored in bottles or tins in conjunction with deleterious conserving fluids, the dangerous character of which was betrayed by the vivid verdant hue of the contents; or they were sold in a dry form, packed in sacks, which certainly pre-

sented an uninviting appearance. Such antiquated methods have, however, now given way to hygienic and more attractive means of supplying the market. The peas, carefully selected, graded, and dried, are now packed in airtight cardboxes in which they well retain their qualities for a considerable time, and when properly cooked yield a dish in every way as alluring to the palate as those freshly garnered from the field or garden in the height of the season.

CARRYING STANDARD STOCK OVER NARROW-GAUGE RAILWAYS.

In connection with our mention in the June number of the problem of carrying standard stock on narrow-gauge railways having been solved by an engineer on a Midland line, a correspondent attached to the Chilian States railways writes to say that such a system has been in operation upon their Coquimbo section for the past eleven years with complete success. From Coquimbo the broad-gauge extends for ninety-three kilomètres to Puntilla, followed by a stretch of mètre-gauge, the extension of which line is now under construction. When the broad-gauge cars reach Puntilla, the contents, instead of being transhipped to narrow-gauge coaches, are run intact upon trolleys carrying a deck of broad-gauge rails, the loading being accomplished by means of special inclines. The coaches are made fast upon the trolleys, and thus hauled over the mètre section to their destinations. Four cars can be handled in this way at a time, and the process is repeated two or three times a day. The system is especially useful, and time and expense saved, at Oralli, where the broad-gauge cars are loaded up with the copper ores from the surrounding mines. There is also maintained a trolley built up of two bogies discarded from the first locomotives shipped out to Coquimbo in 1861, because the sharp curves precipitated so many derailments that single bogies had to be fitted. Our correspondent continues: 'Strange, when I received the June number of *Chambers's Journal* we had a narrow-gauge engine on this trolley brought down for repairs in Coquimbo, the only place where repairs can be done. The engine was run out to Puntilla on the narrow-gauge, and run up an incline on to the trolley. We have transported fifteen engines to Puntilla and back, and I may state that we have not had any mishaps. The trolley is used for heavy weights up to forty-four tons.'

EFFECT OF BALLOONING UPON HEALTH.

Two French investigators have been carrying out experiments to ascertain the effect of ballooning upon health, and the most successful means of combating the peculiar maladies produced as a result of the influences of high altitudes upon the physical balance of the body. A balloon was chartered and equipped with reservoir of pure oxygen and the Agazotti mixture respectively. The latter, it may be pointed out, is a combination of 87 per cent. of oxygen and 13 per cent. of carbonic acid. The effect of the rarefied air was first experienced by one of the aeronauts at thirteen thousand two hundred and eighty-two feet, when he was stricken with a pain in the back of the head and neck, followed by venous congestion of the face, drowsiness, a mist before the eyes when looking towards the earth, and heaviness of the eyelids. The balloon still ascending, the foregoing symptoms were shortly followed by stertorous breathing and loss of muscular power. At sixteen thousand five hundred feet the drowsiness was irresistible, and all interest in surroundings was lost; but some relief was gained by recourse to the gas, which, however, was only temporary in its character unless it was continuously inhaled. The Agazotti mixture was found very efficient and rapid in its removal of respiratory distress up to a height of fifteen thousand feet, but above that altitude only the pure oxygen exercised any permanent benefit.

TRAPPING MOTHS BY ELECTRIC LIGHT.

In order to mitigate the pest of caterpillars which is wreaking such havoc in defoliating the forests of Germany, a novel expedient has been adopted. The irresistible fascination of the candle-flame to the moth is well known, and entomologists are aware that street electric arc lamps afford a happy hunting-ground. The German authorities have turned this point to advantage. An electric light is erected on a suitable tower, beneath which is a deep, funnel-like vessel carrying powerful revolving exhaust-fans. These electric lights are fitted with powerful reflectors, which project the light in two well-defined rays upon the dark background of the forest, half a mile away, in much the same way as the beams of a searchlight. The result is described as remarkable. The hordes of 'brown moths that lay the eggs producing the caterpillars in such enormous quantities, dazzled by the light, come fluttering hastily towards its source. As they near the lamp they become caught in the vortex set up by the revolving fans, are sucked up, and swept through the funnel into a suitable receiver, subsequently being destroyed in the furnaces. So eminently successful was the first night's experiment, when some three tons of moths were caught, that another similar installation is being erected. Though the defoliation of the trees may not be completely arrested, this wholesale destruction of the plague will certainly result in a heavy diminution in the ranks of the caterpillars, and the timber will be saved.

AN OPPORTUNITY FOR INVENTORS.

Among the numerous opportunities open to inventive genius at the present time, there is one problem the solution of which, in view of its vital importance to certain flourishing industries, possesses advantageous financial possibilities. A flourishing trade is maintained in what may be termed the cheap and essential liquids of commerce both of a

domestic and industrial nature, which have to be placed on the market at a very low price. The best example of such a commodity is vinegar. Unfortunately, however, such liquids have to be stored for transit in substantial, well-built, durable barrels made of oak, such as are used for the more costly alcoholic liquors and beverages. The result is that the package is worth more than its contents. Where the material is being transported in bulk, say in casks of twenty-five gallons capacity or thereabouts, the manufacturer seldom experiences any losses in non-returns or damage owing to their cumbrous nature, weight, and expense ; but in those trades where recently it has been found necessary to adopt a small cask, say of six gallons capacity, to meet the demand of small tradesmen, different conditions prevail. The cask is small, and the purchaser often considers it a waste of time to return it to the manufacturer, while the imposition of a charge for non-return by the latter may mean the possible loss of a customer. Moreover, considerable expense is incurred in maintaining these barrels, which suffer severely from damage in transit, and consequently require periodical overhauling, such as rehooping. The result is that the manufacturer finds that the small cask trade is unprofitable, albeit it is a developing factor in his business. To remedy this state of affairs a demand has arisen for a new type of cask, and there are two possible solutions of the difficulty. One is the evolution of a strong small cask, capable of withstanding at least one railway journey, sufficiently cheap to enable the manufacturer to give it away with the contents. In such a case the cost must not exceed one halfpenny per gallon of its contents ; that is to say, a six-gallon vessel must not cost more than threepence, and so on. The second alternative is the production of a cask infinitely superior to the wooden barrel at present used, especially in point of durability, with necessity of repairs obviated, and comparing favourably with the oak cask in point of cost. The vessels, of whatever material composed, must be of the same design as the ordinary cask, and must conform with the regulations of railways and other carriers of merchandise. To the fortunate inventor who can produce a substitute fulfilling the above requirements a rich reward is available. Care must be exercised, however, in selecting a constructive material which shall be able to resist the corrosive or other characteristics of the liquid with which it is to be filled.

MEDITERRANEAN WINTER RESORTS.

The name of Mr Eustace Reynolds-Ball is not unknown to readers of this *Journal* in connection with articles of travel and descriptions of new health-resorts. A sixth edition of his very useful *Mediterranean Winter Resorts* (Hazell, Watson, and Viney) has been issued, revised, enlarged, and in part rewritten. The new chapters include practical hints for winter residents ; the three Rivieras—the French, Swiss, and the English ; and Mogador as a potential winter resort. It is again pointed out that it is impossible to live in the same style or as well in France as in England upon the same income ; the reason being that nearly every article of food—groceries, tea, coffee, ham, bacon, fish, bread, and butter, and every little luxury—is dearer, while gas and firing also cost more. The 'practical hints' are sensible and useful. A rough test is given for suspicious drinking-water. Fill a clean glass soda-water bottle with the suspected fluid, add as much sifted cane-sugar as would cover a two-shilling piece, tie down the cork, and place the bottle for two days in the sun. If it becomes milky or clouded the presence of sewage may be suspected. The indictment of the shortcomings of the Italian railways by the Editor of this *Journal* is referred to also in the 'practical hints.'

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor.

Volume XI. of the Sixth Series of CHAMBERS'S JOURNAL *is now completed, price Nine Shillings.*
A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.
A cloth case for binding the whole of the numbers for 1908 *is also ready.*
Back numbers to complete sets may be had at all times.
Annual subscription, including postage to any address, either at home or abroad, 9*s.* 6*d.*

The January Part of CHAMBERS'S JOURNAL (published about 21st December) will contain the opening instalments of an original and striking narrative of modern life,

ENTITLED

THE HOUSE OF WHISPERS,

BY WILLIAM LE QUEUX,

Author of 'The Closed Book,' &c.

There will be Novelettes and Stories by other well-known writers, and the usual entertaining and instructive Articles.

END OF THE ELEVENTH VOLUME.

Printed and Published by W. & R. CHAMBERS, LIMITED, LONDON AND EDINBURGH.

Chambers's Journal

CHRISTMAS 1908.

A FAMILY SECRET.

By Mrs J. H. NEEDELL,

Author of 'Stephen Ellicott's Daughter,' 'The Story of Philip Methuen,' &c.

CHAPTER I.

A MISTY evening in late December, with a pale sun setting in vapour, and the leafless trees dropping moisture; but it had been a day of brilliant sport with the Wycherley Hounds, and it is with two of the Hunt, now riding homewards with slackened rein, that we have to do.

The one was Anthony Carruthers, the lord of the manor of Frome Quentin, and the other his trusted and trustworthy steward, James Gilmore, a man who had been his father's confidential friend before he became his own.

The younger man was twenty-seven years of age; but the massiveness of his frame and even of his features, which somewhat suggested the old Roman type of virile maturity, made him look older, an impression strengthened by the habitual gravity and reserve of his manner.

His companion was a lean, keen-eyed Scotchman, whose thick gray hair, brushed up on end, left fully exposed a strongly perceptive brow; a careful beard covered the strong jaw and square chin; but in spite of these features there was a suggestion of sweetness in the physiognomy, as though astuteness was fairly balanced by kindliness. From time to time he shot a quick glance at his companion, as if anxious to observe and to conceal his anxiety. There was an unusual softness in Anthony's expression, as though pleasant thoughts were uppermost and precluded any wish for conversation; and, oddly enough, it was precisely this aspect that disturbed the other's mind. He broke a silence which had lasted some time by saying somewhat abruptly, 'After all, the news may not be true.'

The young man started a little. 'One might almost think you did not wish it to be true, but that is impossible. If I remember right, my brother Fabian was your favourite in the old days.'

'Then, Mr Carruthers, you remember wrong. I loved both my master's sons as well as if they had been my own; but the younger was never altogether to my liking. You see, he always kept our fears on the stretch with his wild ways, for the instinct of the vagabond was born in him, and to tempt danger was his delight; and,' he added under his breath, 'it is these same qualities that have probably brought him to an untimely end. I have no faith at all in this newspaper rumour; for, to my mind,

there is only one explanation of a five years' silence.'

'God forbid! I can't understand why you take this attitude of obstinate incredulity, Gilmore; but a few days or even hours may settle the question. I have calculated time and distance to a nicety, helped by Colonel Ashley's local knowledge, and Fabian may arrive now at any time. He escaped from Lhassa on the second of last month.'

'Was *said* to have escaped,' interjected Gilmore. 'You must bear in mind that you have no information first-hand.'

'And I also bear in mind Fabian's aversion to letter-writing and his fancy for always taking us by surprise. Poor fellow! it will be a terrible blow to find no father to welcome him.'

'Filial duty was not a strong point in Mr Fabian's character,' returned the steward dryly; 'he will bear up under his loss better than you fear.'

Anthony turned upon him with a flash of anger. 'Drop this, Gilmore! I have had enough of it, and am at a loss to understand this sudden animus against my brother; one would think you owed him some personal grudge.'

'Nothing of the kind, Mr Carruthers; there is no personal feeling in my estimate of Mr Fabian. It would be out of the question. But facts are facts, and I remember him as a boy, the ringleader of all the young ruffians in the village, making themselves the terror of the farmers round, no orchard or hen-roost safe from them. Even you will allow that in the old days, when he had got his own way and disappointed all the family plans, he never came home without setting the house at sixes and sevens, and worrying my dear master with all sorts of impossible schemes.'

'It is out of qualities like these that heroes are made,' said Anthony, smiling; 'the dare-devilry of the boy hardens into the courage and endurance of the man. What Fabian has seen and must have suffered!'

'Ay, there was good stuff in him! You take amiss what I have said; but I never meant to deny that he was a fine fellow at bottom, and always scorned a lie—a fine fellow in spite of cranks and self-will. Should he come home—I mean *when* he comes home—we shall see what the last five years have made of him.'

The steward's voice dropped upon a note of dejection; but Anthony Carruthers was not prone to probe a man's mood with questions, and for a time they rode on in silence.

Man and beast were weary, and daylight was fast sinking into the gloom of a winter night; not the twitter of a bird was heard nor the rustle of a wing; the only conscious sound was the soft planting of the horses' hoofs in the spongy earth. An unusual sense of melancholy touched the younger man's spirit, and was certainly not dispelled by Gilmore's next observation.

'Yesterday, Mr Anthony, was the anniversary of your father's death.'

'I was not likely to forget it.'

'No; but it reminds me of a duty I am loath to perform. I need not tell you what you know: that Mr Carruthers was my foster-brother, and that I was not only his steward but his friend and confidant through life. I like to think that you yourself have some of your father's regard for an old servant.'

Anthony looked at him with some surprise.

'Surely there is no need for me to assure you of that! If you have felt for us as sons, I have looked upon you almost in the light of a second father.'

'That comforts me and gives me courage to ask a question that will seem to you a liberty; and indeed it would be a liberty if I were not acting in obedience to your father's last instructions. It was a question not to be put except in the case of Mr Fabian's return. You will remember that after so many years' silence Mr Carruthers believed him to be dead?'

A nod of acquiescence was the answer.

'Another condition was that I should not broach the subject until a year after his decease. I suppose he wished to give time for the leaven to work.'

It was characteristic of the young man that, strange and startling as these obscure utterances were, he did not betray impatience or ask questions. They had by this time reached the lodge-gates leading up to the old house of the Carruthers, and here the steward was accustomed to turn off to his own dwelling, a comfortable stone house across the park.

He opened the gate with his hunting-crop for his master, and reared up his tired horse on the off-side. He was ill at ease. 'Your brother is not yet come home,' he said, 'and it will be better to leave the matter until he is one of us. I spoke too soon.'

'I agree that you spoke too soon,' was the answer; 'but, as you have spoken, I desire you will explain. What is the question that was to stand over while the leaven worked?'

Probably because the answer was difficult and opportunity running short, to say nothing of the touch of sarcasm in Anthony's tone, Gilmore blurted it out with a certain harshness. 'The question is this, Mr Carruthers: have you already asked, or do you intend to ask, Miss Delia Fenwick to be your wife?'

Anthony's eyes shot a spark of fire. 'My father commissioned you to ask me this question a year after his death! I find the statement incredible and—offensive.'

'I will not say,' returned Gilmore quietly, 'that this date was fixed precisely; rather it was to depend upon the return of your brother, safe and sound, from foreign parts, which you

tell me is certain; and on the growth, which was foreseen, of your attachment to Miss Fenwick. When these two events coincided, I was authorised to make a certain communication to you.'

There was a tone of deprecation in the speaker's manner which mollified Anthony's displeasure; moreover, he felt no misgiving as to the threatened disclosure. His record was clean and his future assured. It was probably some unimportant detail concerning the property about which it pleased the good steward to assume consequence. All matters really essential were established.

So he answered cheerfully, 'I think you have been decidedly premature in launching your inquiry, and I will postpone my answer till the other condition is fulfilled. I shall be very happy to receive your communication when we have got Fabian safe and sound amongst us. Good-night.' He nodded dismissal and rode on.

The steward remained looking after him until horse and rider were out of sight, and then moved slowly homewards with head bowed in an attitude of dejection.

'Very happy to receive my communication—very happy!' He was recalling the last words he had heard. 'God knows whether, after all, it is well to make it. Circumstances alter cases and confuse conscience—make good evil and evil good.'

CHAPTER II.

A FLOOD of light and warmth greeted the master as he entered the hall.

He was tired enough to drop into one of the chairs close to the blazing logs on the open hearth. The tea equipage was still on the table, and he was about to help himself to what remained, when the sound of a light step on the stairs and the silken rustle of a woman's skirts arrested his action. His glance unconsciously quickened as Delia Fenwick pushed back the intervening curtain and entered the hall.

'No, no,' she cried, rapidly approaching the table and putting a restraining hand on his arm; 'that will not do, Anthony! The tea is cold and the muffins tough. Ring the bell, please. I told them to have a reserve at a minute's notice. How late you are! I expect you have had a splendid run.'

Her voice was sweet and clear, and the uplifted face full of piquancy and charm. The eyes questioning his were blue as pansies and violets are blue, while the abundant wealth of soft black hair which rose above the broad, low brow gave a suggestion of her nationality. There was, too, a vivacity in her expression and in the free movements of her small, lissom figure, as perhaps in her independence of conventional restraints, that may have been an inheritance from her Celtic ancestry; but under any aspect the girl was a very winsome creature.

Anthony resumed his seat and gave himself up to the witchery of the hour. Delia saw his wants supplied, and waited upon him with a sweet solicitude that soothed him into dreams of bliss. Surely she knew that he loved her! Could a girl of her quick perceptions fail to perceive that the expression of his eyes, the tones of his voice, and the habitual reserve of his manner changed and softened in his intercourse with her; that even now, in the small courtesies of the table, his hand shook a little as he touched her fingers, and the austere face glowed into beauty?

. . . . . .

The family circle at the house was a limited one, consisting only of himself, Anthony Carruthers, and the two ladies, Delia Fenwick and her mother.

The latter had come to take charge of John Carruthers's motherless children when the eldest was a boy of ten, bringing with her an infant daughter to whom the pathetic interest of being a posthumous child attached.

Local opinion had at once decided that the widow, who was young and charming, would certainly succeed in consoling, by a second marriage, the man who was still mourning an adored wife; but local sagacity was at fault. Mr Carruthers, who had been in early life the intimate friend of the gay and impecunious Irishman who was Mrs Fenwick's husband, paid fully the debt of friendship by his generosity to his widow and child. He was accustomed to say that the obligation was all on his side, for he had gained an affectionate and judicious mother for his boys, and for himself a sympathetic friend and an accomplished housekeeper.

It was certain that the arrangement worked well, and the eighteen years of its duration had passed with a curious serenity, the only disturbing influence being the wild and adventurous temper of the youngest son. In accordance with family procedure, the second son of the Carruthers was always destined for the Church, with a view to a good family living; but Fabian obstinately refused the provision. His early career was sufficiently stormy; if he was not actually expelled from Eton, his father had at least received an intimation from the supreme authority to withdraw his son from the college, and at Trinity he had been sent down in his first term. In neither case had the youth's transgressions been of a vicious or heinous character, but had sprung from his deep-rooted resistance to authority (characterised by himself

as tyranny), and from a wild excess of animal spirits.

Mr Carruthers was an indulgent father, and allowed his rebellious son to follow his bent, which took the direction of adventurous travel. As it was combined with no common share of courage and endurance, and with alert powers of observation, it was hoped that the nascent passion of the explorer might be turned to practical account.

It happened, fortunately for young Fabian, that Mr Carruthers was acquainted with the able and enlightened man who had just been appointed as Lieutenant-Governor of the Punjab, and who agreed as an act of private friendship to take the youth with him as an unofficial member of his staff. For the next year or two, under the influence of his chief, Fabian prospered, and was even reported to do good work; but he ultimately broke away from all restraints and wandered into remote and unknown regions as will, opportunity, or imagination led.

Probably his foot was the first to have traversed so exhaustively the pathless silence of the Gobi Desert, since made familiar to us by other travellers. Later, the rage of the explorer growing with what it fed on, he turned his investigation to the Pamir district, fraternising with the half-savage tribes; and finally, skirting the Himalayas, found himself in Thibet, where disaster and captivity lay in wait for him.

Five years had passed, as has been said, since any news had been received of the wanderer; but a report had now appeared in one of the leading newspapers giving an account of the adventures of an Englishman who had gained entrance into Lhassa, of his imprisonment and escape, as reported to the Geographical Society, which left no doubt in Anthony Carruthers's mind that the hero of the ghastly experiences was his brother.

Such was the family history up to the hour when Anthony, tired with the excitement of the day, was resting luxuriously by the hall fireside under the delicious ministrations of Delia Fenwick. There was something so sweet, so almost caressing, in the girl's manner that he felt that the hour had surely come when he might speak of his love and win her reply, and yet he hesitated, as he had often hesitated before. Hitherto it had been through some latent doubt of the nature of her feeling for him that expressed itself with such engaging spontaneity, but to-day he was held back by the remembrance of what James Gilmore had said.

While he debated the question and decided upon postponing speech and action, the dressing-bell rang, and Delia rose at once.

'Before I go to my room,' she said, 'I shall run across to the stables to give Saladin the apple I am quite sure he is expecting, and then the dear boy will rub his head against my shoulder and will tell me if you have taken too much out of him to-day. I thought you looked dead-beat, Anthony, as you came up the avenue, for I watched you from my window, and in that case the horse will have suffered more than the man. You are no light weight, you know.'

She laughed gaily and shook her head, then caught up a shawl that was lying near her, and, wrapping it about her head and shoulders —the soft white wool making a charming frame for her brilliant face—ran lightly from the hall in the direction of the back premises of the house.

Anthony sat some little time longer before he went to his dressing-room; for, now that the glow of feeling subsided which Delia's presence excited, he discovered that he was not only tired but depressed, and that the depression was to be traced to his steward's cryptic utterances. At the time he had regarded them lightly, but now they returned upon him with a sense of misgiving. He hated mysteries. Why could not the man have spoken out, or, if the occasion were not ripe, have held his tongue?

When they met at dinner the talk turned naturally upon the chances of Fabian's return.

Mrs Fenwick had been studying anew the *Times* statement of the notes received by the Geographical Society from the traveller. 'They say,' she said, 'that he is the first man who has done this thing and the other: he has discovered the sources of a great river; he has settled the Himalayan problem—though I do not know what that means—and in so doing has risked his life and liberty by penetrating farther into Thibet than any man has done before him.'

Delia's face lighted up. 'We stay-at-homes are all cowards,' she interposed, 'and it is almost more than we can do even to bring home to ourselves the pluck and heroism of the man who first plants his foot in unknown places, and looks down upon the waters and up to the mountain-tops which no human eye has seen before. Think of it! The awful sense of isolation joined to that of self-sufficiency must make him feel something like a god.'

Her mother smiled. 'That is one side of the shield, but there is another; it hurts me to think what Fabian must have endured, for with all his daring there was a deep sensibility at bottom.'

'You are right,' said Anthony, 'though it needed your affectionate penetration to discover it. Perhaps justice was never quite done to him at home.'

'No,' she replied; 'but there were ample excuses. You see, he disappointed all the family plans and upset the tranquillity of the home. As a boy he was always in disgrace, and

as a man in danger. There was no comfort or security about him, and his dear father loved a quiet, well-ordered life.' She paused as if reflecting on the past, then added, looking at Anthony, 'How your father loved his elder son!'

'He was absolutely just,' returned Anthony warmly, for devotion to his father's memory was a religion to him, 'and incapable of favouritism. In so far as Fabian ran counter to all his hopes and plans, so much greater was his generosity in indulging him.'

'And surely,' cried Delia, 'it is only fair that the son who works in his father's vineyard should be loved better, or at least prized more, than the son who refuses to do so; and yet human nature is so contrary that one rather prefers the rebel. As for me, I scarcely remember Fabian; it is five years since he came home, and then I was away and did not see him. And even before that last time I missed his comings and goings. As a very little girl I was afraid of him—he teased me dreadfully.'

'You were a very provoking little girl,' remarked Mrs Fenwick, smiling.

Anthony and Delia exchanged a look of amused intelligence, and the latter leaned towards her mother and kissed her.

'I love you,' she said, 'for being the thorough-paced partisan you are. I am longing to see him!—Is he like you, Anthony?'

'Not in the least. It is hard to believe that we are brothers.'

'Come, that is scarcely fair,' interposed Mrs Fenwick. 'He is not a son of Anak, I grant, but I used to think his bodily frame must be of wrought-steel. I never knew him to be tired; and he has your eyes, Anthony—that is, his mother's eyes, and as a boy he had her beauty too. When you were youngsters I never knew your voices apart.' Then she added with deep feeling, 'After all he has gone through he will surely come home to settle, and you will learn to know each other as you have never done before. You see, Anthony, you were so little together; but Fabian is worth loving.'

She summoned Delia from the table with a nod, and as Anthony opened the door for their exit he took her hand as she passed him and put it to his lips. 'If,' he said, 'I have not loved Fabian as I ought, I love you better for loving him.'

CHAPTER III.

ANTHONY had said confidently to Gilmore that a few hours might see his brother's return; but not only did hours but days pass, until they ran into weeks, and there was still no sign of the wanderer.

The family expectation had grown weary until they were almost disposed to accept the steward's view of the situation—that either the writer of the geographical notes was not Fabian Carruthers or that he had failed to reach his native land.

What struck Anthony as curious was that Gilmore, while showing anxiety as to the issue of the uncertainty, seemed almost indifferent which way it terminated. There had been no further allusion to the communication of which he had spoken, presumably because the conditions remained unfulfilled; for Fabian was still unheard of, and Anthony had not yet asked Delia to be his wife.

But it is a common experience that when hope has grown languid, and acquiescence in disappointment been reached, fruition is granted.

Christmas had long passed and the new year was some six weeks old when the long-looked-for event occurred.

It happened in this wise. It was late in the afternoon of a soft February day; a gentle rain had been falling since morning, but as the sun neared the west it broke through the clouds till a clear heaven was gained for the sunset glories. Delia, who was the only occupant of the drawing-room, having declined to join her mother in a distant call, was drawn from the fireside to watch the unexpected splendour. From the glowing disc, sinking behind the distant hills, level streamers of lurid crimson ran from west to east, while the wide horizon slowly gathered translucent tints of amethyst and pearl. Delia opened the French windows, which were flush with the terrace on which the house was planted, and stood agaze. A thrush in a neighbouring tree suddenly smote the silence with a few delicious notes, and the scent of the washed violets in the garden below rose on the air.

'How perfect, how peaceful it all is!' she said to herself; 'and yet—and yet'——

She did not put into words the vague yearning after something not yet attained which was the mood of the moment, but stood motionless, with a wistful gaze towards the far-away sea.

The sound of a man's footsteps, muffled by the sodden grass, as of one approaching the house through the garden, drew her eyes downwards. She concluded it was Anthony, who had been out since luncheon with his steward about some estate business, to which he paid such exemplary attention; but as he came nearer she saw it was not Anthony, and a sudden flash of conviction flushed her cheek and quickened her pulses.

The man had reached the open window, and stood still, gazing up at the figure framed in the wide issue, whose downward gaze was riveted upon himself; and for a few breathless moments they remained absorbed in the contemplation of each other. Some subtle con-

sciousness thrilled through each that a crisis in spiritual experience had occurred for which both had waited until now.

Then the eager Delia leaned forward and held out her hands. 'Fabian! Fabian at last!' she cried. 'Welcome home!'

He clasped the friendly hands, and, leaping the terraced bank, stood by her side.

'Delia! It is Delia Fenwick?' he asked, and there was an eager note in his voice.

Delia laughed with a sudden sense of joyousness, and drawing away from him, surveyed with still closer scrutiny the lean, lithe figure and the clean-shaven, haggard face, of which the finely moulded features were as clear-cut as a cameo. She leaned towards him in intent observation. 'I had no remembrance of you at all, Fabian, but you look as I have imagined you might look. You have been ill? Is that the reason you were so long in coming? We have looked for you day and night for months.'

'I have been very ill. I was half-dead when they carried me on board at Rangoon, then revived during the voyage; but suffered a relapse at Marseilles, and have been in hospital there for many weeks.'

'And you would not write to your friends?'

'No; the chances seemed against me, and also in favour of my friends having forgotten me.'

'We have never forgotten you!' she cried warmly. 'Your silence has been cruel; more than five years, and not a word! But I forget; you have not been able to write.' Her eyes were soft with sympathy.

'For the last two years I have been unable to write.'

'Forgive me that I forgot, and dared to reproach you. I see you have suffered horribly. You will tell us all about it.'

'Never! A man who has been in hell, tortured by fiends, keeps his secrets. From this hour'—he made an expressive gesture—'I blot out from memory and record those years of my life. Let us speak of other things. Your mother—I always think of her as mine, Delia—and Anthony, my big brother?'

'They are well, both well, and always thinking about you.'

'And he has lived here all these same years, I suppose, with her and with you?'

'Of course—what else? Is he not a great landed proprietor, with the duties of one?'

Fabian shrugged his shoulders. 'It seems to me incredible! What does that mean? The whole estate is in such good order that there is not even the mild interest of pulling down and building up, the tenants on the farms so well content that disputes and evictions are unknown; even the timber stands from father to son, except for landscape effects, because the purse is so full; and for excitement, Delia, what is there?—the Justice's bench three times a week to convict a poacher or fine a drunkard; and for recreation the pursuit of an evil-smelling little animal maddened by the shameful hurly-burly behind it!'

Delia smiled. 'Big game, which means peril to life and limb, is alone worthy of your prowess; but you are not just to Anthony. You forget he is a student, and, I believe, a writer as well. He is a great archæologist.'

'Both pursuits seem to me equally impossible; but every man to his liking. Fortunately for all, I was the younger son, and nothing mattered. They gave me my head.'

'They! You mean your father, Fabian? You have not asked for him—perhaps you know'—— She hesitated.

'Yes,' he said gravely, 'I know that I have no father; that news reached me in our solicitors' office ten days ago, and it cut so deep that I felt in no hurry to show myself at home. Your welcome was very sweet, Delia.'

He seemed restless, and began to walk about the room, examining the pictures on the walls, glancing at the contents of cabinets, and handling the objects of costly bric-à-brac with which the tables were covered, and meanwhile asking eager questions as to which of the old servants were still on the staff, and if James Gilmore still ruled the roost.

'I think I am nervous,' he said, 'and half-dread the meeting between me and my friends. Can you understand, Delia? I have gone through so much that I have felt myself a dead man many times over, and have now the sensations of a *revenant* revisiting the familiar scenes of his boyhood. It comforted me that you knew me and welcomed me, for I was afraid that I was altered out of all recognition, and might be scouted as an impostor.'

He came and sat down beside her, looking into the lovely, blooming face with a wistfulness of expression that moved her sensibly. Then he took her hand and touched it with his lips.

'You must pardon me if I seem intrusive or impertinent, for I have lost the ways of society, and nothing lovely or kind has met my eyes for so long that my gratitude must find some vent. One word, Delia, before Anthony and I meet. You will promise not to be angry?'

'No, no; you could ask me nothing that will make me angry.'

'Are you his pledged wife? It was my father's favourite scheme.'

Delia laughed. Her laughter was delicious, low, clear, and musical. 'Anthony and I are the best of good friends,' she answered, 'as who would not be good friends with Anthony? But we have never thought of each other except as such, or as brother and sister. If it ever were a wish of your father's, I think no one knows it but yourself.'

'Ah! that is a relief, and probably I make a

mistake; my memory has become confused. But they are coming. I hear wheels.'

'I hear nothing; your senses must be more acute than mine. But it is about the time for my mother's return. Will you go and meet her?'

But he had already started up and darted through the open window, intercepting the carriage before it had reached the door of the house. 'Stop!' he cried to the coachman in a tone of command. 'Ah! you know me, old friend?'

In the same moment he had leaped into the victoria and clasped Mrs Fenwick in his arms; her own had been open to receive him, as she gave a little cry of joy. 'My mother! my more than mother!' the man said in a choking voice. 'I thank God time has not touched you. Would you have known me as Fabian?'

'Why, you are scarcely altered, my darling!' was the answer, and it was scarcely a fond woman's falsehood, for the eyes that met her own and the voice that melted her heart were instinct with the old charm and the old expression.

He kept his seat beside her, hand clasping hand, till the entrance to the house was reached, when he helped her to alight and led her tenderly into the hall, where Delia had run forward to meet them. Having thus, as it seemed, secured her safety, he turned back again to the open air.

Mrs Fenwick put a detaining touch on his arm. 'You are surely not going to leave us before I have quite realised that we have got you safe home again?'

'For a little while only. I should prefer to meet Anthony out of doors, and am going to find him. We will return together. Afternoon tea, I hope, is still the custom?'

'But you are bareheaded!' she objected.

He smiled and pulled a cloth cap out of his pocket. 'Do not be afraid. I will not forget that I am in England, and will offend none of the conventions.'

The mother and daughter watched him out of sight, then turned to each other with a look of inquiry.

'How does he strike you, mother dear?' asked Delia. 'Is he as you expected to find him?'

'I hardly dared to hope he would be so much the same,' was the answer. 'My heart is still warm with the embrace he gave me; dear boy! and they dare to say he lacks sensibility! But how does my little Delia like him?'

Delia raised her pretty brows as one in doubt. 'It is early times yet to judge,' she said; 'but he is very different from Anthony.' Her cheek flushed a little. 'Dear old Anthony,' she added, 'how good he is to all of us!'

In the meantime the wanderer was walking slowly in the direction in which he had been advised his brother was likely to come. The last hour had been an exciting one, and he felt that he needed an interval for self-recollection. Also, as he had said, he was anxious to meet his brother in the open air without the restraint of four walls or of spectators. But in respect to the latter condition he was disappointed. He had not proceeded far in the direction of the village when he saw two figures in the distance. One he recognised at once as Anthony, and the other, with a sense of vexation, as James Gilmore.

The recognition was mutual, and both men hurried forward to the accost, the steward discreetly falling a little behind.

'Anthony, my dear fellow, how splendid you look!'

'Fabian, at last, but how altered!'

Fabian flushed with annoyance. 'Nonsense! I am as right as a trivet. A man does not put on flesh who knocks about the world after my fashion, and I have had a bad bout of fever. We have not all your luck. You look like one of the gods of Olympus!'

Anthony smiled indulgently and drew Fabian's arm within his own.

'I am thankful to have you home again,' he said. 'We have been expecting you so long, but you will explain everything. Have you been to the house and seen the ladies?' He implied a further question that he hesitated to ask.

Fabian nodded assent to both, then made a cordial motion towards Gilmore to join them. 'I do not think you have turned a hair or added a line to that dour old face of yours since our last parting at the Victoria Docks,' he said, shaking him by the hand. 'You remember? You wished me God-speed, but implied you had little expectation your good wishes would be granted.'

'Perhaps I was not so far wrong,' was Gilmore's answer, as his keen eyes traversed the young man's face and figure; 'you have been through the fire, Mr Fabian; but I thank God you have come out alive, and purged perhaps of the craze for risking dear life for the least possible gain or no gain at all.' He smiled his grim but kindly smile, and excused himself for taking leave of the brothers. 'You will have much to say to each other,' he said, 'and my say can well stand over till another time.' He glanced significantly towards Anthony, but failed to meet his eye.

Fabian, however, caught the meaning of both look and tone. 'Has the old fellow some secret in his keeping?' he asked as they walked home together. 'He looked own brother to the Sphinx.'

Anthony started a little. 'What secret can he have? There are no skeletons in our closet; but I can think of nothing but the fact that we have got our distinguished traveller safe home

once more. How our womenkind will rejoice over you, and you will set the country-side on fire!' He paused a moment. 'I think you said you had already seen Delia. You would scarcely remember her?'

'I remembered her perfectly as a child; as a woman she is, without gainsaying, the sweetest woman I have ever seen.'

CHAPTER IV.

THE return of Fabian Carruthers stirred not only county but London society. It brought a wave of delicious excitement into the immediate home-circle. Anthony, who was something of a recluse, whose duties were those of the enlightened and beneficent landlord, and whose pleasures were chiefly enclosed between the walls of his library, honoured his brother's reputation by a series of entertainments. Dinners of somewhat old-fashioned stateliness were given to the county—meaning by the phrase the old gentry of royal Dorset—and not to the 'county' only, but to the professional lights and substantial tenant-farmers of a wide district. And what was of far more interest, certain men of science whose names were household words in other countries than their own came down for a week-end visit to enjoy the hospitality of the historic mansion, and to discuss geographical and ethnological problems with the traveller.

All this pleased Delia, partly because no gathering was too grave or academic to be insensible to the charm of her beauty and vivacity, but chiefly because she was intensely interested, not perhaps so much in what Fabian Carruthers had to tell as in the way he told it.

His habitual manner was somewhat languid and weary; but when his subject interested him his whole being was kindled to a flame, the haggard face glowed into beauty, and his voice took a tone of passionate intensity not to be heard unmoved. He had the power not only of describing what he had seen, but of bringing home the impression received, so that the indefinable charm of the desert, whether it took the magical colour of Egypt or that of the sombre stretches of Gobi, stole insensibly into the apprehension of the listener. Over and above this passion of the explorer were the acuteness and exactitude of his observations on the previously unknown tribes he had discovered, and the intelligence of his deductions; but now as always—though his Thibetan experiences were sought after as of supreme interest, and he had here also much to relate—he could never be induced to enter into detail of the captivity he had endured or of the sufferings inflicted. 'There can be no interest,' he would say, 'in details so purely personal.'

Then there was a week of golden experience, when the whole family went up to town in order to hear Fabian Carruthers read his paper before the Geographical Society. Delia and her mother thrilled with triumph as they looked round upon the sea of faces all intent on that unit of adventurous humanity who, with the impersonal zest of the scientific explorer, related the important issues of his five years' wanderings. Not even the taste of London gaieties—the theatre, restaurant, or dance—weakened the glow of Delia's enthusiasm.

It seemed to Anthony at this time as if he were the mere spectator of events over which he had no power of influence. He was generously alive to the unique charm and interest of his brother's personality, and equally alive to the spell it exercised over the girl he had hoped to win.

She and Fabian were constant companions. They rode together, and together took walks of a distance unknown to Delia's enterprise before; and when in the evenings the mood of impatient restlessness was upon him which household quiet seemed to provoke, Delia, who had a delightful musical gift, would play and sing to him by the hour—the David, as she expressed it, to his Saul.

It was keen in Anthony's recollection how capricious had been her acquiescence when he had asked for the same indulgence. Up to this time his mind and leisure had been so occupied with the business and stir following Fabian's return, and, later, in the patient, quiet watching of the growth of the feeling between him and Delia, that he had all but forgotten his steward's postponed communication.

His was a nature so deeply reserved under its superficial pleasantness that few, if any, guessed the strength and depth of the undercurrent. With Anthony Carruthers duty had become a passion; and although he had not great sympathy with his brother's wild love of adventure, the bias of his own mind was alien to the life and interests of a mere country gentleman.

As Delia had said, he was a student and an archæologist of considerable distinction; and if he had followed his inclinations they would have led him often abroad to the great centres of literary research for the purposes of discussion and comparison. But he was the representative of an old and honoured house, and his father had died in the happy conviction that Anthony would be content to fulfil the functions of a large landed proprietor and county magnate. Also, to give charm to the rôle, John Carruthers had thought it probable that his son would love and marry Delia Fenwick.

Anthony had fulfilled the expectation so far as desire went, but the issue threatened to work

out in disappointment. Until Fabian's return he had persuaded himself that his love was in the way of being recognised and reciprocated, or perhaps he had rather tried so to persuade himself. The girl's sweet friendliness at times fired and at times chilled his heart. It was pleasant to meet the frank tenderness that shone in her dear eyes, and warmed the pressure of her hand, and gave value to the solicitude that remembered and consulted his personal tastes; but the doubt forced itself that such frank affectionateness lacked the subtle essence of love.

But if he had shut his mind against this fear hitherto, he was no longer self-deceived. Delia, with Fabian, at once eager and shy, with the changing colour on her cheek and the eyes radiant with happiness as they met the answering light in his, and with voice instinct with passionate sympathy for his every look or word or action, taught him how the lover differs from sister or friend. If Fabian were absent the girl seemed indifferent, with an unaccustomed touch of irritability; but when he entered the room, and at once, as his custom was, drew near to her and claimed her attention, her whole being quickened and responded, and her loveliness took on a new and more enchanting aspect.

There was no marvel in it. Fabian's personality was magnetic, and there was the aroma of romance and heroism about him. He had stories to tell of surpassing interest; stories, too, from which self and arrogance were curiously eliminated, and which gained a double charm from his natural eloquence and from a voice of subtle sweetness and expressiveness.

CHAPTER V.

IT happened one morning, some time after the London visit, that Anthony was awaiting a visit from Gilmore on some points of business connected with the plans for a cottage hospital which he desired to erect on the estate. The steward was late, and Anthony rose from his desk and sauntered to the window. The room used as an office overlooked, but at a considerable distance, a secluded corner of the gardens employed by the head-gardener as a nursery for spring blossoms.

Delia often visited the preserve with garden scissors and basket, as she loved to choose and cut her own flowers for house decoration, and Anthony saw she was standing there now with Fabian beside her. He had taken two or three daffodils from the basket in her hand, and was holding them against the soft masses of her hair, pleased with the charm of the contrast. The girl looked up smiling into the face bowed above her own, and the man bent his head responsively until their lips met. In the next moment Fabian held her clasped in his arms, though this Anthony did not see, for he had recoiled from the window with an intolerable pang.

As he turned he came face to face with Gilmore, who had entered the room so quietly as not to have been heard. There was a moment's awkward pause, for Anthony doubted whether he might not have betrayed himself to the keen observation of the other; but there was no hint of it in his manner. He had the architect's plan of the hospital in his hand, which he at once spread out and began to discuss details. Anthony pulled himself together, but the effort was severe. Delia and her mother had been greatly interested in the scheme; but of late, since Fabian's return, the girl's enthusiasm had cooled, but that, as he said to himself, was no excuse for neglect or indifference on his part. Gilmore had never known him more mentally alert or his suggestions of greater value.

When the matter had been fully discussed he still lingered, although his penetration showed him that his master had no inclination for further business. He had already got up from his seat and turned to the door, when he came back again to the table; there was still on his mind an undischarged obligation.

'May I speak to you, Mr Carruthers, on a subject I have mentioned before? It lies heavy on my mind.'

Anthony looked up impatiently. 'Do you mean the matter you spoke of before Fabian's return? Is it really important? I am not much in the mood for further business.'

'There is no doubt of its importance. I have been to blame for putting it off so long.' He hesitated, and looked at the young man with an expression that softened his features. 'It is not good news,' he said in a lowered tone.

'Then by all means let us have it—straight out, Gilmore! You have a way of beating about the bush.'

The announcement had served as a challenge; Anthony threw off regret and dejection, and braced himself to meet the disclosure. A misgiving, such as he had not felt before, took possession of his mind.

For a minute or two Gilmore fumbled with the papers in his hand, then asked tentatively, 'You remember your mother, Mr Carruthers?'

'Remember my mother! Can you forget that I was ten years old when she died, and that I worshipped her? I have never seen any other woman like her—so lovely, so sweet, so saintly.' His voice dropped on a note of exquisite tenderness.

'She was all that, and no doubt you know that Mr Carruthers made her acquaintance in Quebec, and that she had French-Canadian

blood in her veins. No doubt it is from his mother that Mr Fabian gets his quicksilver. She was the only child of a widow, who died quite suddenly and left her daughter alone in the world, and almost penniless. Your father, who was already very much in love with the young lady—her name was Adela Bellairs—— But you will know all this, Mr Anthony?'

'No; some of these things I never heard before.'

Gilmore fidgeted a little; he was evidently uneasy. 'Mr Carruthers at that time, unfortunately, held views on the question of the marriage bond that he lived bitterly to deplore. It was not the outcome of any lightness of principle or of conduct, but of opinion. He had read a great deal of what I call false and dangerous philosophy, and he had known of some very unhappy marriages. He thought the tie should not be indissoluble, so that it could be broken when faith in each other or love failed. He persuaded your mother, who was very young—almost a child—and who looked up to him as the best and wisest of men, to take the same view.'

He stopped a moment in his story, and then added, but without looking at the other, 'You were a year old, Mr Anthony, when your father married Adela Bellairs.'

The blow had fallen and produced no sound. Anthony sat motionless, with stern, set face, and eyes fixed on the speaker; while Gilmore hurried on with a feeling of relief that the worst had been told.

'At the time that I am speaking of—that is, before and after your birth—Mr Carruthers had not the smallest expectation of succeeding to the family property. His elder brother George was alive and married, with two healthy boys, and a good prospect of more to come. Then a very pitiful thing happened: the boys were smitten with diphtheria and died within a few days of each other; the poor mother, who had nursed them, in defiance of infection, following them to the grave. Your uncle George, whom, of course, you never knew, was a broken-hearted man; he died through an accident in the hunting-field, from which it was said he might have recovered if he had had the will to do so; but life to him was no longer worth living.

'When this happened I was sent out by the family solicitors to inform your father and bring him home. It was well known here at Frome Quentin that he was married and had a son, no one having the least suspicion that the union was an irregular one. He was living at this time in a remote part of Italy, perfectly happy in a romantic seclusion which most men would have found irksome. It was, of course, the first time I had seen your mother, and I thought I had never seen so lovely a creature—Mr Fabian favoured her when he was a boy—or such perfect love and harmony as ruled the household. You were a very fine little fellow, and the idol of both.'

Once again he paused, oppressed by the unbroken silence, and this time he looked at Anthony almost piteously.

'My dear master,' he urged, 'have you nothing to say?'

'Nothing,' was the answer. 'Go on to the end.'

'Well, Mr Anthony, you will not wonder that the news I brought affected your father painfully. His first thought was of you. "Could I have foreseen this I should have acted differently," he said. You know I was his foster-brother, and he gave me his full confidence. I think compunction had been growing since the birth of his son, and now the question of property and family honour came in. He lost not a day in righting the wrong; but, leaving me in charge of the household, he crossed the frontier with your mother into Switzerland, where they were married according to the rite of the Anglican Church in the first town that offered facilities.

'After, we all returned to Frome Quentin together, he and his wife and child being cordially welcomed by the county. No breath of suspicion stirred, nor has it ever stirred since; from that hour to this the secret has been kept, and in the event of Mr Fabian's death or disappearance it was decided by your father that you should never know it either.'

Anthony's hand shaded his face so that Gilmore could not read its expression.

He resumed in a tone meant for consolation: 'There is no single human being, save myself, who knows it; from their first union at Quebec there was no friend to interpose a question. Marriage was taken for granted, and afterwards it was the same in Italy. The English clergyman who finally performed it supposed that the beautiful girl before the altar was a bride like any other. So implicit had been her reliance on your father that no question of wrongdoing had troubled her mind previously. On the other hand, Mr Carruthers deplored his error bitterly—time, I think, deepening the impression; but to make the truth known would have tarnished the reputation of his wife and disinherited the son he loved best. He argued that the only person injured by it was your brother, unconscious of the injury and quite indifferent to the position that was legally his.'

Anthony looked up. 'Then, when did you get your commission? How was it that my father changed his mind?'

'I think that it was during his last illness that the possibility of Mr Fabian being still alive and coming home weighed on his mind. In that case I was to tell you the truth, especially if you were likely to marry Miss Fenwick, as it would be unfair for her to be deceived. But I was to speak to you only that you might decide

whether or no to keep the secret which injured no man, so that all things might continue as before.'

'I see,' said Anthony in the same quiet tone as before. 'Have you any proofs of what you have told me?'

The steward looked at him wistfully; he felt baffled by his self-containment. 'I have carried this little packet about with me for some time,' he answered, drawing it forth from his breast-pocket as he spoke, 'and it is both a pain and a relief to me to put it into your hands. It contains a letter from your father, the seal of which was to be broken by no one but yourself, and also the certificates of your birth and baptism, and of your parents' marriage.'

He put down the packet on the table before Anthony, who had shown no inclination to take it in his hands.

'The certificate,' he said, 'of the birth and baptism of a son to John Carruthers and Adela Bellairs. You can go now, Gilmore; you have done your part.'

The tone was so incisive that the steward rose; but his heart was wrung with sympathy. It is when the wound is mortal that there is no outcry. 'My orders were,' he broke in, 'to destroy all those papers if your brother did not return or was not heard of for a year after your father's death. I could find in my heart to wish I had done so.'

'In that case you would have done a cruel wrong.'

Gilmore ventured to put his hand affectionately on the speaker's shoulder, but Anthony shook it off.

'Go!' he said sternly; 'go, as I bid you!' And then, as he met the suffused, faithful gaze, he added more gently, 'Go, for I can bear no more.'

CHAPTER VI.

LEFT alone, Anthony suffered his head to fall on his arms folded on the table before him, while wave upon wave of anguish and humiliation passed over him. There had always been an element of special tenderness and solicitude in his father's treatment of him; now it was explained—it was the attempt to expiate the inexpiable wrong. And his sweet and beloved mother, whose innocence had been sacrificed to a man's perverted dogmatism! The thought of her action cut him to the quick, and was only to be endured by the consideration that sins of ignorance are expunged from the divine record. Then, may it not have been that, having learnt to recognise the truth, the knowledge of it had given to her character that lovely humility amidst so many graces that had endeared her to all who knew her?

The crucial question remained: was he bound to bring shame upon that sacred memory? His own loss, although he felt it to the full, was what least affected him. Every man of honour and manly temper shrinks from the brand of illegitimacy, though Anthony's nature was too virile and self-poised to accept it as impugning his actual worth. Another consideration weighs with all conscientious men: when a post of responsibility has been held, and fulfilled, it goes hard to pass over its duties to another obviously unfit for them.

But that other—his brother Fabian? It would behove him to give up his life of adventure and assume the headship of the family, a family the distinction of which exceeded that of many a brilliant peerage; and to reconcile him to the unwelcome position, he would have won Delia Fenwick to share it with him.

And for himself? The conditions would be too hard to admit of his remaining a member of the household. There was a limit demanded by self-respect; he must make a career for himself at a distance from a home where he had sustained so complete an overthrow.

A lurid light was now thrown upon his father's will, the terms of which had excited attention and speculation when read: 'According to the strict family entail, I leave everything of which I die possessed in real or personal estate to my eldest son, with injunction that he should make an adequate provision for his brother.' The omission of the brothers' Christian names had provoked considerable surprise as well as the incisive brevity of the deed. A few legacies to his steward, to his lawyers, and to servants of the household followed; but these were conveyed in the briefest terms. Many years before his death he had invested a considerable sum of money for Mrs Fenwick's benefit, with reversion to her daughter, so that no question as to their provision could arise in the future. Upon these problems a sinister light was now thrown: *his father had arranged for potentialities.*

As Anthony raised himself from his attitude of dejection his eyes fell upon the packet which Gilmore had placed before him. He had said it contained a letter from his father. Anthony opened it, and before breaking the seal of the letter examined the certificates enclosed. They were precisely what the steward had said: the register of his own birth and baptism under the name of Anthony Carruthers, and the certificate of a marriage between John Carruthers and Adela Bellairs at a date when it was evident that the child was in his second year. There was no flaw, no room for question or doubt, and the reader studied and replaced the documents with the rigid but dignified self-command which braces brave spirits in the crisis of disaster.

Then he broke the seal of his father's letter. It was, after his father's way, brief and incisive:

'When you read this, Anthony, you will know from James Gilmore that I have done you and the angelic woman who bore you what is held to be an irreparable wrong. I do not know if the son will forgive the father; but, if not, enmity does not pierce the grave. I have called it irreparable, but that is at your discretion. I conjure you to consider whether any good end will be gained by betraying the secret of your birth, casting dishonour upon a sacred grave, and giving to your brother a position for which he is unqualified and does not desire. But, decide as you may, my blessing—such as it is worth—goes with you.'

As Anthony reached the conclusion of this letter a second time, he was interrupted by a light knock at the door, and Delia's voice asking, 'May I come in?'

Had he been less engrossed he must have heard her footsteps; but, as it was, the interruption seemed like the sudden awakening from a frightful dream. She did not, however, wait for permission, but opened the door and entered.

He saw that her face was radiant, and that she wore amidst her soft black hair two or three daffodils charmingly disposed. As he looked at her he had a vague sensation as if a cycle of time had rolled between them since he saw her last and had received that wound to his love.

What had he now to do with love or with Delia? He folded up the letter he still held in his hand, and slipped it carefully with the other papers into its cover in order to gain a moment's time to recover his usual manner. Then, 'What is it, Delia? You don't often venture into my den.'

'The luncheon-bell has been rung twice, Anthony, and you know when you are in the house my mother never likes to sit down without you, so I offered to go and see if you were too busy to eat to-day.' She gave one of her sweet little rippling laughs, and, drawing nearer to him, put her hand on his arm. 'That is not quite all the reason why I came. I wanted to speak to you alone, before we all met at table.'

She blushed a little, and bent her graceful head until it almost touched his shoulder; then, as if scorning her shyness, she looked up, her eyes soft and shining with tender excitement. 'I—I wanted to tell you how happy I am—that is, how happy *we* are—Fabian and I. I wanted to know that you would approve—you have always been to me my incarnate conscience, Anthony—that you would not mind our loving each other.'

He stood looking down upon her, at the love-light in her sweet eyes and the delicious colour on her cheek; in her attitude there was something wistful and appealing. 'Why should I mind, Delia?' was his slow answer. 'All we want for those we love is that they should be happy, and you know that I have always loved you.'

'But not as Fabian loves me?' she asked quickly.

'No, not as Fabian loves you.'

She looked at him with some uncertainty, then dropped her eyes and moved away from him. 'You do not look quite like yourself,' she said; 'I should be afraid it was my news, and that you did not quite approve, only that I noticed it when I first came in. I know Mr Gilmore has been here, and no doubt he has been worrying you. You will feel better, Anthony, when you have had something to eat.'

He laughed, and in spite of himself he could not keep the bitterness out of his laughter. Lunch as a panacea for a blasted life!

He turned back to the table to pick up the fateful packet and put it in his breast-pocket. Then to Delia, 'You are right. Gilmore has been tedious to-day. Let us try what having something to eat will do for both of us.'

CHAPTER VII.

WEEKS passed, and spring slowly melted into summer; the horizons widened over the sun-drenched Dorset downs and over the distant sea. Nature seemed to have reached the point of perfect fruition and to be holding it in equipoise for a brief transcendent period.

Never had the wide demesnes of the Carruthers showed greater prosperity, whether it was the corn in the arable fields whitening for the harvest, the luscious triumph of pinery and grape-vine, or the varied splendours of the flower-garden. Farm, homestead, and mansion seemed sunned in full content.

Anthony was very busy, more so even than his wont, in examining every detail, whether agricultural or financial, of the estate; leases were confirmed or renewed, and in some cases a farm changed hands; the stock in the home-farm, the horses in the home-stable, and even the members of the household staff were all subjected to a strict scrutiny with the view to weeding out anything that did not reach the standard of excellence.

Gilmore, associated in all these varied transactions, followed his master's lead in observant and dutiful silence. No word had passed between them on the subject of the late disclosure; but no word was needed, for every action meant renunciation.

It had been the custom for Mrs Fenwick to take Delia for a few weeks to town during the London season, Anthony owning a small house in Hans Place. The house was let on lease to a friend of the family, who was always willing to accept arrangements for the annual visit;

sometimes Anthony went with them, but more frequently he took the opportunity of a trip to Paris or Berlin to compare notes with his Continental friends on scientific subjects common to each. This year, however, it was agreed that all should stop at home.

The lovers found satisfaction enough in themselves and their surroundings, or perhaps it would be more accurate to say that one of them did so. It was obvious to the intent but veiled observation of Anthony that Fabian was growing restless, and, if not weary of love, at least weary of domesticity, and that his own consciousness of it tended to melancholy and irritability; therefore the elder brother decided that the time was ripe to make known to him his true position, and so to provide him with new and adequate interests at home. The acknowledged head of the Carruthers must cease to be a wanderer over trackless wastes and amongst alien tribes, and must establish himself with the sweet woman he had won for wife to fulfil the functions demanded by society and custom.

From the first apprehension of the bitter truth Anthony's resolution was taken; to surrender that to which he had no legal right was to his mind no refinement of integrity, but a claim of justice from which escape was impossible. If he had used delay, it was simply that he might put his house in order, and also that he might make sure that Delia's well-being was in the way of being secured.

On this point he was far from satisfied; Fabian was not of the temper of which satisfactory lovers are made; he was still untamed, excitable, enamoured of action and change. Delia loved him with the passion of the hero-worshipper, touched with humility, as such passion always is; he loved her as a phase of feeling hitherto unknown to his strange experience of life.

To Anthony's sense of personal loss was added the sharper pang of knowing that she who was his heart's desire was building up her future happiness on an uncertain foundation; and surely to see the good misprized for which we would willingly lay down our own life is as great an unhappiness as the remembrance of happy days in misery. There was at times a wistful expression in her eyes, an unconscious pathos in tone and manner in her intercourse with her lover, that wrung his heart with anguish.

The consolation on which he relied was that the fundamental change in Fabian's position would also effectually change his point of view; and, having at this time fulfilled all the duties he had set himself as trustee of the property, he decided to take the first opportunity of giving him the momentous information. He had made his personal arrangements which would take him far away from the wedded lovers reigning in his stead in a home that would be his no longer; nothing remained to be done except the act of surrender.

It had been a day of incessant rain in the midst of a dry and flaming June; but towards evening the rain ceased, and the grateful earth was sending forth its mingled odours from dripping bough and herb and petal, and the birds, silenced by the downpour, were bursting into pæans of song.

Delia and Fabian had been whiling away the hours together over the piano and a portfolio of photographic sketches that he had accumulated in his travels. Anthony, who was, as it were, lying in wait for his brother's leisure, had shut himself up in the library, a room he loved, and now loved all the better that its associations were to become a memory.

As the rain ceased he had opened the wide windows and carried the table on which his book rested to the deep recess they formed, so as to be better able to taste the sweetness of the world outside. His mood was not a studious one, though he had compelled his attention to his subject, and it was with a throb of mingled satisfaction and reluctance that he heard the door open and saw that it was his brother who entered.

'I hoped I should find you here,' he said, advancing. 'I have wanted to have a good square talk with you for the last week or more, but you are so hard to catch; one wonders what you can find to do.' He pulled a chair to the open window and sat down with an air of weariness.

'I am tired to death, Anthony—tired of sloth and household comfort, and the awful drudgery of the day's routine, and I am come to make a clean breast of it to you.'

He pulled Anthony's book towards him and looked at the title-page; it happened to be a volume of Mommsen's *Rome*. He pushed it from him with a smile. 'It passes my understanding,' he went on, 'how a man of your thews and sinews and splendid health can dribble out existence over a printed page!'

Anthony smiled rather grimly. 'A love of books for some of us,' he answered, 'is a better possession than houses and lands. I am glad you have found me out, Fabian, for, as it happens, I have had something on my mind to tell you for a much longer time than a week or more. Shall we be interrupted?' He rose, crossed the room, and closed the door, which the other had left open.

'I think not. Delia and her mother were going out for a drive when I left them; they wanted me to go with them, but I draw the line of subservience there.'

He laughed a little, and passed an impatient hand through his crisp, curling hair. Rest and ease and good living had filled out the hollow cheeks and the sharp outlines of his figure.

Fabian Carruthers was perhaps less interesting to a sentimentalist, but far more satisfying to the ordinary observer.

Anthony's feeling, as he looked at him, was that he had never known before how near his brother's good looks touched on manly beauty. He began to speak. 'Since we have both something to say, I claim the right of the elder to speak first; besides, your business cannot be so important as mine. It concerns a family secret, and will hurt you a little. You must understand that I have only known it since your return.' There was no mistaking the importance of what Anthony might be about to say, for voice and expression were weighted with meaning.

Fabian drew his chair closer to the table, and with his elbows planted upon it and his chin in his hands, gazed steadfastly into Anthony's face. 'If it hurts, why tell me?' he asked. 'I see it hurts you, dear old fellow. Is it necessary?'

For answer Anthony drew out the packet he always carried about with him, and, selecting the three momentous certificates, pushed them across to his brother. He had no intention of showing their father's letter, which suggested a course he declined to adopt.

'I think,' he said, 'the shortest, at least the easiest, way will be to let these documents explain themselves. After, I will give you all the particulars which James Gilmore gave me.' He got up and took a turn or two through the long room; to sit opposite to Fabian while he was making himself master of the bitter truth was more than Anthony could bear.

Silence reigned; he saw that his brother had spread the three strips of official paper open before him, and was intent on their investigation. Presently a sharp exclamation escaped him; then, in a stifled voice, 'Good God!' he said.

Then Anthony went back to the table. 'I see that you understand.'

'That our father was a scoundrel, and our mother'—— His voice broke with passion.

'Not that, Fabian! not that! He was a dreamer, and went astray; but as soon as he awoke he redeemed his error. You must hear the story as James Gilmore told it.'

Fabian listened with close attention, and looked up eagerly as Anthony ceased speaking. 'If no one knows, if the secret has been so well kept, what does it matter? I will take your view of it, and forget what I have heard.'

'You lose sight of one important fact that what was a secret is one no longer, so far as you and I are concerned. To hush it up is now impossible; we both know that our positions are radically changed.'

'You mean'—— Fabian stopped short and bit his lip.

'I mean,' said Anthony firmly, 'that you take my place, a place to which I have never had a right, and I'—he hesitated—'not yours exactly, for I have not even the claim of a younger son, but the place which our father indicated by will. He foresaw this.'

'Am I to understand,' asked the other, rising to his feet, 'that you are to publish to the world the scandal of your birth?'

'What else can an honest man do?' was the stern reply. 'I bear the penalty of our father's wrongdoing; but to refuse to bear it would stain me with deeper dishonour. You have been kept too long out of your own.'

'But my own, or what you call my own, I refuse to accept; no power on earth could induce me to take on my shoulders the weight of inheritance.'

'Ah! that is because you have not had time to consider, and you speak in the heat of surprise and good feeling. No doubt you too will have something to give up; but there is the obligation of duty on your side as well as on mine.'

Fabian shrugged an impatient shoulder. 'In the event of my turning country gentleman do you turn vagabond?' he asked dryly.

'Not after your fashion, nor beyond the bounds of civilisation; but I go away from the old home and from Frome Quentin. I have thought it all out, Fabian; you will soon reconcile yourself to your new position; possession and independence are persuasive influences, and for full consolation you will be better able to make Delia a thank-offering for her love.'

For a moment or two Fabian stood in silent deliberation, his brows knit and head bent; then he looked up with an air of decision.

'Did I not tell you before this wretched business was handled what you must have seen for yourself, Anthony, that I find my life here insupportable? I was coming to you as my father-confessor. All that you have told me goes for nothing. I repeat that neither heaven above nor earth beneath nor even the depths below would induce me to change places with you, quite apart from any decent consideration for the family honour or natural affection for my big brother. As we were in the eyes of the world so we remain. Not a breath of all this shall stir the air outside. I refuse to inherit; I refuse to be an accessory to your precious scheme of restitution.'

He stooped over the certificates that lay open on the table as though to examine them anew; and then, before Anthony could divine his purpose or interpose to prevent it, he tore across and across the registers of birth and of baptism.

'Pardon me,' he said, 'but it was the shortest way out. There is little more than a year between us, and this certificate of legal marriage'—holding it out to him as he spoke—'shall answer for us both. Who knows—who cares to know? It shall remain a family secret.'

Fabian glowed with satisfaction.

[*Christmas Number.*

Anthony put his hand on his brother's shoulder. 'My dear fellow,' he said gravely, 'you have done a rash and generous thing; but it makes no real difference. We cannot alter facts. Nothing is easier than to obtain copies of what you have destroyed.' He picked up the fragments as he spoke.

'But who will ever care to do so, or know that such evidence exists? I have often heard our father say that you and I were now the sole representatives of the Carruthers, and in our default the Crown would inherit. Be reasonable, Anthony! But no man is so unreasonable as one bent on a preposterous act of self-sacrifice.'

'It is curious,' was the answer, 'how you seem to lose sight of the consideration that ought to weigh most with you—that in taking your rights you offer Delia Fenwick a position any woman might welcome.'

Fabian looked up with an air of finality. 'But I shall never marry,' he said, 'either Delia Fenwick or any other woman. It was precisely this that I came to tell you before you had so unnecessarily diverted my mind.'

Perhaps Anthony was less surprised than might have been expected; but none the less the blow aimed at Delia seemed to strike against his own breast. 'You will break her heart,' he said slowly.

'I should much more surely break her heart if I married her,' was Fabian's reply. 'I was meant for no woman's husband—the slavery of domesticity is intolerable, and there is nothing in me that responds to the call of family ties. You are going to tell me I have behaved infamously. Well, I am still human, and Delia at the beginning took me by storm; and, after, she charmed and soothed me because I was only half myself, worn out with the cruelty of my bad time at Lhassa. I should desert her sooner or later, and, in dread of my bondage, should never return. Delia is for you, Anthony—with all the rest.' He got up and shook himself with the gesture of a man flinging off a burden, and smiled up into his brother's stern and frowning face. 'More! I have told her this—convinced her that I have been wrong and am now right, and she has taken it like the sensible girl that she is. She understands what I have pointed out to her, that her feeling for me is a phase of sentiment, a glamour not in the least capable of standing the workaday test; and at the bottom of her discriminating soul lies the image of a man every way superior to myself, and able to give her all of which I possess nothing. Delia swerved from you as the needle swerves under climatic influence, but it returns to its allegiance.'

'You have told her this?'

'And more besides, which I now hasten to tell you. My plans, Anthony, are made for departure. I am possessed with a new impulse stronger, I think, than any which has moved me before. I have offered myself to join the forthgoing Antarctic Expedition, and been accepted. All I ask is that you should interpret liberally the *adequate* provision allotted to me in our father's indefinite will. Money, and plenty of it, will be wanted, and I am anxious to do my part according to my means.'

He stopped as if to study the effect of his rapid utterance in the other's severe and clouded face. He was going on, when Anthony silenced him with an authoritative gesture.

'I will not have it,' he said sternly; 'all the revenues of the estate are yours, and if I consent to stay here it will be that I may administer them in your interest.'

'And you will keep our secret—our mother's secret?'

'Would to God I might, and be justified in so doing!' was his answer.

Fabian's eyes softened; Anthony's strength of feeling appealed to his deeper nature. 'Dear old fellow,' he said, and slipped his arm affectionately round Anthony's neck, 'one word more, and then an end to all discussion. If what you hold is mine by some legal informality, I give it back to you as not worth my keeping. It is not a gift but a disburdening. This business is never to be mentioned between us again.'

Anthony shook his head. 'It cannot be,' he said.

'Then I have another suggestion to make. We will put the matter before old Langdale; one's family solicitor is a sort of father-confessor, and he has served the Carruthers for three generations. I went to him before I came down here, and he was like a father to me. He shall draw up some deed that will salve your conscience; it shall take count of my legal status, but give you full powers here at Frome Quentin as my representative. Do you follow?'

'I think under any circumstances it is a good idea to consult Langdale.'

'It is simply the only good idea. Wire to him—have him down to-morrow. I am keen to be in London looking after my outfit for the Southern Seas and getting to know my comrades. Before I go—before Langdale goes back—I will make a will leaving all I have, known or unknown, to you. And now nothing remains to be done but to send off a groom with your telegram to Dorchester. Get it ready!'

CHAPTER VIII.

MR LANGDALE, of the well-known firm of Langdale, Somers, & Blyth, did not delay in responding to the urgent summons of the Carruthers brothers. He arrived late in the evening of one day, proposing to defer business till the next, and so, as a recognised friend of the family, to make a

holiday of his visit to Frome Quentin. It was not, therefore, till the evening of the second day that the three men met in the library of the house for discussion of affairs.

Dinner was over, and the old lawyer, although no sybarite, was pleasantly soothed by the influences of a perfect menu admirably served and enhanced by wines of superlative excellence, to which had been added the stimulus of charming female society.

'I never know,' he was used to say, 'which is the more delightful woman—Delia Fenwick or her mother.'

The morning had been spent, at Anthony's suggestion, in riding over the property in company with James Gilmore in order to take note of the condition of things, and the afternoon in financial investigation, the upshot of which was so eminently satisfactory that Langdale felt no anxiety as to the matter concerning which he had been summoned. He sat in the embrasure formed by the wide windows, which were open to the cool evening air, and looked down upon the spreading lawns planted at this point with groups of forest trees whose deep shadows lay motionless on the close-cut turf.

Anthony had placed himself at a little distance, and Fabian stood near him, so as to be able to walk to and fro as his restless temper might prompt.

'James Gilmore keeps us waiting,' he observed with considerable irritation; but as he spoke the door opened to admit the steward.

Langdale observed with surprise that he looked flushed and anxious. He took a seat at some distance.

'We have been waiting for you, Mr Gilmore,' Langdale said pleasantly, 'to give us certain information; but, from what I have seen to-day, without any apprehension of its nature. Mr Carruthers tells me you have something important to communicate.'

The man looked towards Anthony, who answered with a nod of assent.

'I am instructed,' he began in a low tone, 'to tell you certain circumstances in the late Mr Carruthers's life with which no one, in this country at least, was acquainted except myself, until it became my painful duty to put Mr Anthony in possession of them. The proofs are in his hand.'

As the steward made his recital, precise in every particular, Anthony watched the lawyer's face with absorbed interest until it kindled into indignant surprise on perceiving how little the communication seemed to affect him.

'And the proofs to which reference has been made?' asked Mr Langdale. He spoke in his quiet, professional tone, and his expression was inscrutable.

Anthony offered him the torn fragments of the certificates, explaining the generous impulse which had prompted their destruction; and then Fabian, restless under the steward's deliberate story, interposed with an eager statement of his own view of the situation and of the course he wished to be adopted.

'Mr Gilmore alluded to a letter of the late Mr John Carruthers to his son,' remarked Mr Langdale. 'May I be permitted to see it? It is an important factor in the case.'

Anthony hesitated. 'Is it necessary? It is strictly personal.'

'As corroborative evidence I think it is strictly necessary.'

Having carefully perused the letter which was still reluctantly surrendered, Mr Langdale, without obvious change of expression, was handing it back to Anthony, when Fabian interposed.

'It is surely my right to see it too,' he said; and the lawyer relinquished it into his outstretched hand, watching his face as he read with obvious interest.

Fabian gave back the letter to his brother with kindling eyes.

'It is easy to see, Langdale, which son the father loved best—rather, I was of no account—and it is just as hard to discover from whom our good Anthony gets his fine sense of honour.'

'I ought not to have kept it back,' said Anthony. 'Its injustice might have led you to different conclusions; but you are not bound, Fabian, by a single word you have spoken.'

'It certainly might,' cried Fabian hotly, 'had you sheltered yourself under its sinister suggestion; but since you defied it'——

He was going on, when the lawyer held up a protesting hand. 'The controversy one way or another is fruitless,' he said, 'for I am happily in a position to state what will be acceptable to both of you, since the fraternal bond is so strong. In the face of these certificates, rashly torn but easily duplicated, I am legally authorised to pronounce Anthony Carruthers, as his baptismal register names him, the legitimate son of his father.'

He paused to give effect to his words, and, though neither of the three men who heard him broke the strained silence, an influence of incredulity seemed to emanate from each.

'Mr Gilmore is my countryman,' continued Mr Langdale, 'and his knowledge of the marriage-laws of his own country will confirm what I am about to say. But he appears ignorant that his late master was ever in Scotland.'

'I was not aware of it. I had no close relations with Mr Carruthers from the time he left Frome Quentin for Canada until I was sent to Italy to find him.'

'That is explanation enough. I am aware he only stayed a few days in Edinburgh, and the visit never seems to have impressed his mind. He was in absolute ignorance of its importance. I am not at this distance of time prepared to say what brought him there; but it was almost immediately after his return from

Quebec, and consequently close upon his informal union with Miss Adela Bellairs.—Now,' addressing Anthony, 'whatever may have been the relations of your parents before the Edinburgh episode, and of those until to-day I knew nothing, your mother became his legal wife before they left the Scotch capital, although it is obvious that her husband was ignorant of the fact. I was a young man at the time, but already in practice, counting your honoured grandfather as a client, and acquainted with his son, John Carruthers. We met in Princes Street by accident, when I was walking with one of the University pundits—his name has since become a household word—and he has to this day a lively recollection of the incident. We met, I repeat, by accident, and your father introduced to both of us the lovely young girl who was leaning on his arm as "my dear wife." Personally I never doubted that she was such already; but if otherwise, as you have taught me to-day, from that moment their union was legalised. Such is our far-reaching law.'

The reaction of feeling was severe. James Gilmore rose and shook the lawyer's hand with painful fervour, as if overwhelmed by personal gratitude; then, with a delicacy that did him honour, he escaped from the room after casting a lingering glance of affection towards Anthony, who sat pale and speechless, oppressed by feelings too complex for instant expression.

But Fabian had no such reserves. 'The gods are on my brother's side,' he said with animation, 'and I rejoice at it! The rôle of benefactor does not become me, and I drop it without a regret. I shall sail the Southern Seas with a lighter heart now that I leave him with no weight on his.' He stooped to Anthony's ear and whispered, 'The last obstacle between you and sweet little Delia is broken down, and I shall listen for your wedding-bells amidst the Antarctic ice.'

THE COPSE IN WINTER.

As through the copse I wend my way
  This cold, clear winter morning,
The harsh alarm-note of the jay
  Screams out a word of warning.
The magpie scolds with strident note,
  But keeps himself in hiding;
And, look! with stealthy steps a stoat
  Through the long grass is gliding.

The hoarfrost glistens, silv'ry white,
  On bracken-frond and bramble;
And trailing berries, gleaming bright,
  Over the hedges ramble.
With noiseless feet the rabbits glide
  Through tangled brake and bushes,
Or scamper down the sloping side
  With furtive little rushes.

The long-tailed tits, a fairy troop,
  The branches sway and flutter;
The great tits swing, and twist, and stoop;
  The squirrels peep and mutter.
And on the ground, where grubs are found
  In curled leaves snugly hidden,
The blackbird pries with eager eyes,
  And makes a feast unbidden.

Oh! sweet and rare is robin's song,
  And merrily he sings it;
His message cheers my eager ears—
  Thrice welcome he that brings it.
While, overhead, the berries red
  Of yew-tree and of holly
Gleam, as a light in darkest night,
  To ward off melancholy.

The creeper flits from tree to tree,
  Each trunk in turn ascending;
The goldcrest hovers like a bee,
  The fir-tips scarcely bending;
While greenfinches and chaffinches,
  Gathered in flocks together,
Seem to defy the wintry sky,
  And care not for the weather.

Ah! who shall say the copse is drear
  On a bright winter morning?
'Tis true, the chiff-chaff won't be here
  Till April days are dawning;
And all the sap must bursting be,
  And all the buds be sprouting,
Before the cuckoo calls to me
  With glad and joyful shouting;

Gay daffodils must deck the slopes,
  And violets fill the hollows,
Ere I can realise my hopes
  Of meeting with the swallows;
And tender green must clothe the scene
  With beauty fair, though fleeting,
Before the blackcap's liquid note
  Sets all my pulses beating.

Yet beauty lies in cold blue skies,
  And black boughs interlacing,
As well as in spring's magic green,
  Or autumn's golden tracing;
And dullness I can never know,
  While friends in fur and feather
Remain with me through frost and snow,
  Through gray and gloomy weather.

IDA NORMAN.

THE TREASURE-MAID.

A STORY OF HEARTS AND DIAMONDS.

By EDWIN L. ARNOLD,

Author of 'Iyvinda,' 'The Haunted Smoker,' &c.

WAS it my fault? I write these notes in the dim lamplight of a little Welsh inn-parlour, while across the room my fair young wife talks driest business to two men from the big town fifteen miles away. And as I listen vaguely to them there rises between us a haze of remembrance, and in it the figure of a fair peasant girl standing in broad sunlight at the mouth of a cavern—a girl in ragged skirt, with royal gems in her hair and on her wrists. As I look she tears off these gleaming things, and, throwing them far away into the blue lake below, clasps her hands over her face, and—the embodiment of shame and remorse—fades into the shadows.

'Tom, they say the treasure in the cave is worth fifty thousand pounds at least!'

No! I could meet the silent reproach of those eyes and say again and again I had not been to blame. Long ago I had come up into the solitude of the Welsh mountains to read for an examination which was to make or mar my fortunes. The examination was partly in the history of the ancient Principality, and there was fascination in following the incidents of almost forgotten wars and border feuds on the very spots where they occurred. I remember in particular a story of King Edward I., and how, worsted for the time, he fled before a Welsh prince, hiding the treasures of the royal camp in some never-discovered spot amongst those very hills where I had chanced to take up my lodging for the time being.

The gray mountain-track winding from my village up the glen and over the pass beyond must have been the very road along which the monarch retreated; and day by day, book in hand, I re-read his story and a score of others equally exciting amongst surroundings which they made classic. Wandering thus, one day I met a mountain fairy, a girl beautiful in a way as her own hills. Poor Nell O'Neal! I learned afterwards she had never been very strong of intelligence, and a life spent between drudging for the old crone with whom she lived, and in wandering at all hours over hill and valley, had done nothing to teach her the gentler restraints of womanhood.

An act of help on my part in shepherding the half-dozen swine she was guarding, and some shy thanks from her, began a most platonic friendship. We met and spoke together some few times afterwards over the tumble-down stone walls about her hovel, the scent of heath and ling coming to us on the mountain air, and the gleam of water lighting up the shadows under the gray precipices about the glen; and then, alas! the day came for me to go southward to work. Had I been vainer than I was, that bouquet of wild moorland flowers which I found on my table the morning of my departure might have warned me that my fair-faced peasant-girl was sadder perhaps at my leaving even than myself; and the remembrance that on each succeeding occasion when we had met her colour had deepened, her partings had been more and more reluctant, might have told me that something was amiss with the heart that lifted and fell, when I came, so visibly under Nell's faded mountain shawl. But I was not vain. And, more than that, I was troth-fast; all my thoughts far away with a girl as fair even as my sweet swineherd—she who, if all went well with that examination, was to be my wife before a year was over.

What could be more natural, the ordeal of books and papers having ended satisfactorily, and Jeanie having become my wife, than that I should have brought her into the Welsh mountains for the honeymoon? We put up at the familiar inn, and the second day after our arrival I walked alone into the hills. Poor Nell by that time was almost forgotten, and I was surprised to meet her on a sudden in a narrow path winding up to a cave in the face of a gray crag above a mountain lake. Her delight was undisguised, and somehow—as I noticed the pretty colour rush into her face, and the harebells twisted hastily but artistically into her tresses—somehow it seemed to me she had known I was coming, and was not there by chance. We sat down and talked, or at least she did. It was very pleasant, and though I felt guilty enough, what man would have been hasty to end such a friendship? I had an instinctive appreciation that a confession of the wife in the village below would have made all the difference to the sunshine of that pretty face so eagerly turned to mine, and I let her ramble on. To-morrow would be early enough to tell her.

The next day I was there again with that resolve in mind, and the Welsh fay was there before me! This time she was in the strangest, wildest spirits. She swept away my resolution

like a leaf down one of her native torrents; in ten minutes she was making love to me, the fierce, innocent love of her untaught nature in the presence for the first time of overmastering emotion. She literally would not let me speak. She flung herself down at my side where I sat on a lichened rock, and overwhelmed me with the floodtide of her pent-up feelings.

'You know I love you. I know little of men, yet surely any man with half a heart or the dullest of souls would have known it before now. And you love me—you must, you shall, you do! I am not ugly, am I?' and as she spoke she threw back her head, her fair hair flowing about her sunburnt face, her cheeks glowing with colour, her eyes dancing with the light half of love and half, alas! of the frenzy behind them.

'Ugly!' I cried; 'surely as beautiful as any mountain nymph with which history has peopled these wild glens of yours.'

'Not ugly—no; nor mad, as they say down in the village; or would not be if you could love me. No, not even poor! You said once in moody fashion last year that it was hard to keep a wife and house with little to live upon. I have that wherewith we might be rich past all our needs. Look! Men value these things, I have read, and I will give you ten—a thousand times as much for your love.' And, plunging her hand into the bosom of her dress, she brought out under my astonished eyes a yard-long string of amethysts set in red gold, a royal plaything which I knew even at the first glance was worth a modest fortune. Adroitly twisting it in her hair, as no doubt she had often done before with some fern-rimmed pool for mirror, she turned her laughing face towards me and looked up, shy and wistful, in my eyes. Then, slipping her hand again under her shawl, she brought forth a broad gold bracelet of medieval workmanship, set with sapphires and clasped with two Plantagenet lions twinkling in diamonds and rubies. Never peasant-girl played with such things before! This she put daintily on her wrist and held it up to the sun to see it sparkle—as pretty a picture as one could wish for—with the light in her face, the old-world gems shining on wrist and forehead, and behind her the deep shadow of the cave-mouth. When she had toyed with these things for some time she nestled to me again.

'Not ugly—no; nor mad, save perhaps in one thing only'—hanging her head, as she spoke, with a blush; 'and with a fairy dower rich enough for us both to live upon as we would. Speak! for I love you.'

'Dear Nell O'Neal,' I cried, the inevitable emotion of a man contending with my compassion, 'I would not have had this happen for anything. What you wish is impossible—quite impossible.'

'Impossible! Why?'

'Why, because—if I must speak, then, in truth—I am hand-fast already; my month-old wife is down in your village yonder.'

'Wife! Wife!' she cried, slowly rising to her feet. Then she was still as marble for a few moments, and I saw the veins swell on her forehead and a tremor pass through her form, though her eyes never wavered nor were taken from my face. She stood so, not moving for another minute or two while I wondered what would happen, whether her stress would turn to fury or tears; and then very slowly her hands were lifted, she took off the gold band from her hair and the flashing gems from her arm, and, rolling them up in nervous fingers by a turn of her wrist, threw them far out into the lake; and I winced—for I was very poor—as I saw the water gleam and bubble as they sank into the blue depth. Then, like one in a trance, without another word or sign of recognition, she went by me, disappearing down the path, and I presently returned to the village. There, that evening, I told my wife what had happened.

Next morning early I determined to take Jeanie up to see the lady of the cave, and just as we were ready there she was herself at our door. She came in, and when she saw my pretty southern sweetheart, stood looking a minute steadfastly at her, then went forward, and in the gentlest way, taking both the lady's hands in hers, kissed her on either cheek. Next she took my hand and kissed that, and looked at both again, and tried to speak, but failed. Then hurriedly, as if to change our thoughts, she brought out a little parcel from under her ragged shawl, and untying it, said it was a wedding-present, an unworthy one, but it would pleasure her if Jeanie would take it; and so speaking, she laid out before us a glorious rope of Eastern pearls, a royal gift, a thing a queen might have worn with pride, and clasped again with more Plantagenet lions!

Before we had half-begun our astonished thanks, she kissed Jeanie again, as if the interview were trying her more than she could endure; and, turning to me, asked if we were friends.

'Friends, dear Nell O'Neal! How could it be otherwise?'

'I am glad of that,' said the girl. 'You have chosen the most gracious and lovely lady surely eyes ever saw. May the good God make you both happy!' As she spoke she handed a note in an envelope to my wife, who put it unheedingly into the guide-book she had in her hand at the moment, forgetting henceforth all about it.

When poor Nell had left us, and disappeared down the village street, looking neither to right nor to left, Jeanie turned to me and said the girl's manner had made her uneasy. What was she going to do? Where did those fairy gifts of hers come from? 'We must go after her,'

said my wife, translating our thoughts, as she often does. And as I too was anxious, in half-an-hour we were on the precipice-path by the cave-mouth where we thought we had caught a glimpse of Nell's shawl as we came up the glen. But she was not to be seen. All that afternoon we searched, and the following day the villagers joined in looking for 'mad Nell;' but neither high nor low, at home nor abroad, could she be found. I searched till I was footsore and weary, and then, sorrowful and lost in surmises, turned from the hopeless pursuit.

. . . . . .

Three years afterwards another holiday-time had come round, and hunger for the hills was again upon us. We decided we would go back once more to the old village, and in our preparations got out that guide-book Jeanie had been reading when Nell said good-bye, and which we had never looked at since. We were poring over its suggestive pages one evening, when out of them dropped a faded envelope.

'It looks like a tradesman's circular,' I said.

'Or an unpaid bill,' suggested my wife. Then she took it up, turning it curiously in her fingers for a minute or two until the truth flashed upon her, and, springing to her feet, 'Oh Tom,' she cried, 'don't you remember?'

'Remember what?'

'Don't you remember how poor Nell O'Neal gave me a note as she left us that day, and how I, with incredible carelessness, put it in the book I was reading? This is it. I have never thought of it till this moment. Oh, what will it say? What will it tell us? Her last letter perhaps on earth!'

With quick fingers she tore the frail envelope open, and within, on the cheap, village note-paper, we found a few lines penned by an unskilled writer:

'LADY,—I wish to give you something to make you and him happy. They are not much, but I have often played with them. Some is pretty, and if you sell them in the village you can buy a cottage and a pig. Go to the cave over the lake and lift the matted ling on the right. Squeeze into the crack and don't be afraid of the dark; there is a tallow-candle in a mug on the ledge. What's inside the cave is for you and him, and you will please sometimes remember her who would have you both very happy. NELL O'NEAL.'

'Nothing about herself,' I said, 'in all that; but the cave may tell us something of her. What can those pretty things be which she has for us? Poor girl, we could do with a few more of those jewels, though it is not likely she alludes to them. Where she got the others is a boundless mystery which I have often pondered on.'

'In any case we must see this cave,' Jeanie exclaimed; 'it will perhaps tell us more of Nell. She has been constantly in my thoughts, and you know women hate an unsolved mystery.'

Even then we did not appreciate the true facts. However, we packed and started for the north, Nell and her cave only one item of interest in our holiday. But when we had arrived, and re-read that note in the very parlour where it had been given to us long before, we became keen to solve the mystery.

Early the next day we started together up the glen, reaching the familiar cliff-path, and noting as we went that the girl's cottage was deserted and dismantled. Presently the blue lake lay below us on the left, and at a turn in the path there was the cave on our right. It was a shallow cavern such as sheep shelter in from storms, quite unpretentious in appearance; no one would have thought there was more about it than showed at the first glance, but like many others it was tapestried by the vegetable growth of centuries. Within its shadow once more we read the letter, and, according to its instructions, searched under the curtain of ling on the right. There, quite unobservable from outside, we *did* find a cleft, like a wing on a theatre stage, leading back into the rock. I lit two candles we had brought—for the 'mug' Nell had alluded to was nowhere to be seen—and we entered the narrow passage, which, after a yard or two, turned suddenly inwards, and then, in complete blackness, opened a few paces farther on into a roomy vault. As our eyes grew accustomed to the dark and the dim yellow shine of our candles, we saw a vault piled nearly to the roof with an incredible jumble of ancient packages. Such a cave of funereal splendour none ever entered before. Bales, boxes, and chests were piled everywhere on each other. Here were sheaves of rusty spears and halberds; there saddles (some beautifully embroidered with Eastern workmanship) and sumpter-cloths for mules lay in piled confusion. There was rusty armour enough to fit out a tournament, a score of helmets falling into red decay under their faded plumes, and mouldy banners cobwebbed to the walls with the dust of centuries.

That was what we saw at a first glance. When, as our eyes grew stronger, advancing hand in hand, we noticed old coffers, newly opened, with jewels and gold lying within in splendid disorder or thrown about and stamped into the loose sand outside. There were treasure-chests from whose worm-eaten crevices piles of money had trickled out, and bundles of ancient deeds lying everywhere. All these things led back to the inner shadows where the piled lumber narrowed until only a single passage was left, and here the heaps of ancient luggage were overlaid by a confusion of fabrics obviously unpacked in recent times: the ghosts of royal velvets sewn in seed-pearls with fleur-de-lis and lions rampant, dim silks plundered from

Saracen palaces, moth-eaten Spanish embroideries and linens. Jeanie's woman's eyes lit on these at once. She took up one piece of tarnished white from amongst a hundred others. It was heavy with lace, ragged, soiled, and fell almost to bits at her touch. Yet there on the bosom, beautifully stitched, we could make out the initials 'E. Q.'

'What will that mean?' she asked.

'Eleanor the Queen,' I answered, for I was now beginning to guess the riddle of the cave.

'Oh, poor Eleanor!' said my wife, laying the fragment down and taking up her candle.

She made two steps forward, stopped, stared into the dark, and, with a cry of terror, dropped her light, and in stepping back extinguished mine also—a cry of horror which in that narrow place seemed to echo from a hundred gloomy recesses and to be repeated again and again as though the place were full of spirits.

'Jeanie! Jeanie!' I cried as she stood trembling in my arms, 'what is it—what is it, dear?'

And between my wife's quick-coming gasps I heard her whisper, 'Nell—Nell O'Neal!' Thereat I must confess a strange feeling ran round the roots of my own hair; for it was black as winter midnight in there, and Nell had died, we thought, three years before.

'A light! a light!' sobbed Jeanie.

Where were my matches? I had as many pockets as men usually have, and through them all I went unsuccessfully. Then suddenly I remembered with deep chagrin that in lighting our candles I had put my match-box down at that entrance lying far away in some unknown direction. Once more I went through my pockets, with no sound breaking the close stillness but Jeanie's stifled sighs; and then, by luck, I found a single overlooked lucifer in a corner of my coat-pocket. It was worth all the treasure in the cave at the moment; but when the candles were alight again Jeanie quickly mastered her emotions and fearfully pointed to a pile of old throne-cloths lying on a rough couch made of chests. There, half-sitting, half-reclining, was something suggestive of a human form, wrapped in time-stained velvet—a human form beyond a doubt, as we looked closer—and streaming over the knees from the head part to the feet fell a cascade of yellow hair, a veil of weird brightness that caught our lights and shone with unearthly glow in that dim, forgotten place.

A minute for our hearts to beat steady again, and then we went forward and found the veiled form was in truth what had been Nell O'Neal. By her side was the 'mug' she had spoken of, a lovely jewelled chalice containing the burnt remains of a tallow candle, and she herself—wearing the same shawl, the very same dress she had on when she left us—was sitting as she had died in that gloomy crypt, the quaintest play-place that could be imagined for such a sunny maid.

For a while we stood by her in silence with bent heads, and then I took Jeanie into the cool outer air; and afterwards returning, gently wrapped that poor remnant of humanity in its faded royal velvet, and carrying it easily, for it was no heavier than a leaf, took it forth and down the steep path to the glen. There Jeanie went for help while I remained on guard, for I did not want all the villagers to know of—and plunder—those riches so strangely found, which were beyond question the lost treasures of King Edward I. which I had read of years before.

But when the treasure-maid was put away in the little churchyard, and no relative, not even a friend, had come forward to claim through her, we told our story to authority, claiming our right to the cave as finders of treasure-trove.

'And they say it is worth fifty thousand pounds at least, and we share in proportion! Oh Tom, we are rich past all our needs, and all owing to that dear, poor, foolish Nell!'

I stooped and kissed my lady on the forehead, glad in her gladness, but otherwise sadder to be rich than I could have dreamed possible at any other time.

CHRISTMAS: A SONNET.

ACROSS the white and silent fields they sound—
Those sudden, clam'rous voices of the bells—
As hamlet unto hamlet far around
Flings on the greeting, till on distant fells
Some lonely dalesman—o'er the frozen ground,
'Midst gleaming crags and deep snow-muffled dells—
Hears their glad echoes break the peace profound
Of that wild solitude in which he dwells;
And, listening, marvels, as within him rise
Visions of that first wondering ecstasy
Which shone in those Judæan shepherds' eyes,
When erst heaven's radiance flashed upon their sight,
And angel voices filled with melody
The starry stillness of the Eastern night.

V. CRAIGIE HALKETT.

VANDALEUR OF CASTLE CLARE.

By F. C. ARMSTRONG,
Author of 'Cousins,' 'Two Letters,' &c.

CHAPTER I.

'  O you think that letter genuine, and not a hoax?' queried Myles Vandaleur, with a pucker on his brow and a light of battle in his eyes. 'If it isn't a humbug, I call it a piece of bally impertinence.'

The girl who sat opposite to him at the dinner-table looked up from the page before her with bright, soft eyes. 'Most certainly it is not a humbug; neither is it in the least impertinent, Myles,' she said in a voice that matched the eyes, being soft and winsome. 'I am sure it is a real, *bonâ-fide* question, asked with a view to business. It is quite a nice letter, taking everything into consideration.'

'But what business has any Yankee under the sun to inquire whether we did or did not save any old furniture out of the fire which took place twenty years ago? How does the fellow come to know about our misfortunes? Hang it all, chuck it into the fire, and be done with it! I'm not going to take any notice of the thing.'

'I'm not so sure,' the girl laughed softly. 'I won't burn it; and if you won't answer it I will. The man is probably collecting curios to palm off on his neighbours—in St Louis, is it not?—as ancient family relics. Dear Myles, we are not so rich as to be able to afford the risk of refusing a good offer. He may have heard from some one of the dozens of emigrants from this neighbourhood a report of the fallen splendours of Castle Clare, or he himself may have been one of them. All that was saved from the fire was huddled into the big hay-loft, and lies there still, unless the old things have rotted to pieces.'

'I know,' returned her brother, drooping his head. 'But it isn't pleasant to be reminded of the fact by an utter stranger from Yankeeland that we have come down in the world.'

'But it is such an old story, Myles. After all, we are no worse off than our neighbours.'

'Small satisfaction that!' groaned her brother.

'Come now, Mylie, we haven't known much difference in our time,' the girl said very gently; 'and how will it harm us if in far St Louis this son of the soil—who, as I say, may have come from this part of the world—points with pride to some of our old sticks, and tells his envying friends that they came from his old home? Dear, would it not be better to sell the whole lot of them—I'm sure I don't know what they are—than have the poor cabinets and bureaus rot amongst the hay? Dear, let the man come—I'm sure he's a gentleman—and have a look at them at any rate; it won't do us any harm. Why should we keep them?' Her voice sank low. 'We shall never be able to rebuild the house.'

'Never!' said the young man gloomily. 'The most we can hope to do is to keep this bit of it habitable.'

'We do that well,' she returned, with a vivid smile, as she rose from the table. 'Let us build one of your favourite castles in the air.' Her voice took a lighter tone. 'This American will arrive and prove quite charming. He will give us fancy prices for our damaged belongings; he will have a look at the mine, and exploit it; Grayling will take first prize at the horse-show next year, then go over to England and win some big race, all on account of this American, who will prove to be a millionaire whose ancestors' bones lie in St Morgue's Abbey beyond the lough. In fact, we shall be able to restore the old house, the old name—the—the—— Oh Mylie, you are far better at building air-castles than I! Do add a crocket or a pinnacle to my edifice!' She turned her bright face upon him, with its fresh, pure colouring, and the exquisite sweetness of expression which betokened a beautiful nature. 'Come, your finishing touch to the castle!' she cried gaily.

A curious smile twitched the corners of his shapely mouth as he looked up at her. 'The American millionaire will unite himself to the House of Vandaleur,' he said.

She flushed scarlet. 'I did not expect that from you, Myles,' she said as she walked towards the door.

'Why, you needn't flame up for a trifle. Can't you take a joke?' he cried.

'Not a joke of that kind,' she said with a proud uplift of her head. 'Cathy will bring your coffee to the drawing-room.'

'Now, be sensible, Flo! You must help me with this letter. What shall I say to the fellow? Ask him to come for a day?' He made a wry face. 'We can put him up, eh?'

'If he comes he must stay the night,' Florence Vandaleur said, pausing at the door. 'He will have to take us as he finds us.'

She opened the door and crossed the flagged

passage which had once been a back hall, with the master's office and the housekeeper's room opening off it. The office served as the dining-room, while the housekeeper's room was now the pretty and tasteful drawing-room. She entered with her light, graceful step. Her attractions owed nothing to her dress, which was of cheap material, cheaply put together by a workwoman in the village; but her every movement was so gracious, her step so light, her head so airily set upon her shoulders, that you forgot the frock.

For all that it had not been built for my lady's chamber, the pretty, quaint drawing-room had a look of almost luxury, even although the velvet pile of the old carpet was frayed in places and the rich damask curtains were faded. The gilding of an antique console-table between the narrow windows was badly tarnished, and the glass above it dim; but the room had its own air of refinement, just as an inexpensive dress could not conceal the graceful dignity of its mistress. There was a cottage piano in a recess; books and music filled some shelves in another; flowers were on the mantelshelf and the table; a few pieces of rare old china were placed about. It was essentially the home of a lady and a place of rest.

Florence Vandaleur knelt down upon the hearthrug and roused up the dull peats in the old brass grate. There was a curious expression upon her face; a little line defined itself on her forehead; her lips quivered. Some vague sense of expectancy was upon her, aroused by this unforeseen letter. The light seemed to catch in her deep-gray eyes, while her lips parted. She leaped to her feet. There was a sound of wheels on the gravel outside, a sharp ring at the hall-bell, and a pleasant voice in the hall.

'Hope it isn't too late to look you up,' cried the pleasant voice; 'but I didn't like to pass you by, so drove up on chance.'

Then her brother's reply: 'Man alive! don't you always know you are welcome at any time of the day or night?—Hi, Tomsey, take the horse to the stable!—You 'll find some one hanging about there still, I 'm sure. Had any dinner, old man? Flo will see to your comforts.'

'I have just been dining with Father Joseph. Managed to get away early—said I had business. If Miss Vandaleur will give me a cup of coffee'——

'Right you are, old man!' cried Myles Vandaleur, as he flung open the door of the drawing-room. 'Here's Flo waiting to do her best.—Aren't you, Flo?'

She was very composed as the two young men entered the room. There was something stately, even old-fashioned, in the air with which she greeted the unexpected guest; but it was very genuine and sweet withal, and the man flushed under it, with a certain touch of embarrassment in his manner that to a more experienced woman would have been a betrayal. He was, like her brother, a tall, well-set-up man in the early thirties. He had the same breezy freshness about him that both brother and sister possessed. He had round him that nameless look of breeding which marked his host and hostess, although he was nothing more distinguished than the local dispensary doctor. He talked freely to his host, although his eyes were on the graceful figure pouring out the coffee; but the girl looked absolutely unconscious of his following glances.

Myles was already enlarging upon his perplexing letter.

'I think Miss Vandaleur is quite correct in her surmise,' said Stephen Browne. 'I have heard the old people talking of a man who went to the Far West more than half a century ago who is popularly believed to be enormously rich.'

'But it isn't a local name,' said Myles. 'Cecil P. Lavine: there are no people of that name in the village, and certainly it is not in the list of old tenants on the former estate.'

'It sounds like an old Huguenot name anglicised,' the doctor said. 'Might not that give us a clue? That beautiful furniture was certainly the work of the refugees. Why shouldn't this man be descended from the maker? There's an easy solution of the mystery for you!'

'And a pretty cheap one too,' returned the host. 'Flo thinks we had better let him come and take his choice amongst the old things. She says we may as well turn them into money as allow them to rot in the hay-loft.'

'Miss Vandaleur shows her sense,' Dr Browne answered, with a smile that made his plain face turn positively handsome. 'Moreover, you will most likely find the writer of that letter a cultured gentleman, whatever his forebears may have been. I have met dozens of perfectly charming Americans.'

'Well, we 'll see. If he does turn out a decent chap, why, we 'll give him an idea of Irish sport—that is, unless he 's an old fogy caring only about mouldy old cabinets and such like. We could give him a day on the mountain, or do a bit of cub-hunting. If he can ride I might put him on the gray colt. I tell you what, Steve, that fellow is shaping out splendidly.'

'Suppose this Mr Cecil P. Lavine offers you a long price for him?' cried Dr Browne. 'They do give long prices for good horses in America.'

'No, no,' cried Florence laughingly; 'no horse-dealing with one's guests. I draw the line there.'

Then she went to the piano and played for them. She possessed a delicate, airy touch upon the keys that could be light as the flicker of summer leaves, yet tender and pathetic as it woke the deeper harmonies of a weird

'Berceuse' of Chopin, or lingered through the cadences of an old Irish melody picked up note by note from amongst the peasantry and worked into her own modulations.

The doctor listened with that betraying expression on his face. He posted a reply to the momentous letter on his way home.

CHAPTER II.

'BY George, Flo! if Aunt Jess could look out of her grave she wouldn't know her room,' laughed Myles, as he glanced round the apartment prepared for their guest.

'It went to my heart to be obliged to hustle away all her dear old belongings,' Florence answered with a sigh. 'Dear, dear Aunt Jess!'

'She was a dear, good soul,' Myles granted; 'but she was over a hundred years old, and, after all, she was only our grandfather's sister—pretty far off, you know.'

'She was the only relation I ever knew,' said his sister.

'Well, well, we aren't troubled with many cousins. Perhaps it's just as well,' her brother responded with a light laugh. 'Suppose the fellow who is coming—didn't he jump at the invitation?—turns out to be a low cad, eh?'

'He will be our guest,' she answered gently. 'When do you start for the railway station?'

'Very soon. I asked Steve Browne to dine—he knows Yankee ways. I don't want to bother about a wayfarer. To-morrow we'll see about the old sticks.'

'The old sticks, as you call them, are anything but rubbish. I have had them carried down from the loft.'

'The whole lot? He may pay us well for them if his taste lies in that direction, eh?' Myles glanced at his watch. 'I must be off,' he cried. 'It wouldn't do to keep the fellow waiting, and I've left myself but a narrow margin. By-by, dear girl.' He was out of the room and half-way downstairs as he shouted back his farewell.

His sister went to a window which overlooked the stable-yard. She could hear his resonant voice calling to the men, and then the crunch of wheels on the pavement; the crash of the closing gate seemed to follow in a flash.

Upon that sound came a shrill voice raised in expostulation. 'Well, sweet bad luck to you, Tomsey Gallon!' it shrilled. 'Didn't you all but let the big gate smash into the back of the car the masther has laid out whips o' money on May was a year?'

'Augh, sure the gate didn't go next or nigh the car, woman dear,' returned another well-known voice. 'How could it, an' the masther drivin' off like a waff o' wind, so keen is he about this 'Merican gintleman that's to be the makin's o' the family.'

'It's a sthrong job he has set him to do,' said the woman sarcastically. 'An' what way would he be for doin' it, now?'

The man's voice, with its easy sing-song drawl, reached her: 'Troth, the same way the rise came into another big family hereabouts. How did the Marquis get his debts paid?'

Florence recoiled. How the allusion stung her! Myles had suffered his tongue to run overfast. Their nearest neighbour had taken his title into the transatlantic market, and brought home a bright young Western girl, whose millions of dollars had regilt an ancient title and redeemed the possessions of an ancient name. Ah, poor Myles! how had such an impossible contingency filled his brain until it overflowed in a jesting word to a faithful old retainer? It was foolish of her to feel wounded by such careless gossip, yet she was sorry she had overheard the little dialogue. She must not suffer it to make any difference in her demeanour to this stranger. No; he would be their guest, and therefore worthy of all consideration; but she could not help wishing devoutly that the new-comer might prove to be a married man with a large stake in the future. Poor Myles! poor dreamer of impossible dreams! For herself, she may have had visions, but a wealthy marriage was not one of them.

And how different were the associations which this room held for her! For nearly eighty years of a life prolonged far beyond the average, the whole career of its occupant had been one long self-sacrifice. Here had dwelt that beloved great-aunt who had been a mother to her and to her father before her. The room had been 'Miss Jessie's' from the day when she, a bright young girl, took up the weighty task placed in her hands, devoting herself to the father whose tyranny had driven his sons to rebellion and exile, she alone remaining with Colonel Vandaleur, the 'Bad Vandaleur,' in his advancing age.

Three of the four brothers whom she dearly loved lost their lives in distant parts of the world—one here, one there; but the old man only rode more recklessly and drank deeper, until he rode his last hunt, and was carried home dead. Then Eustace, the eldest brother, about whom there were whispers circulating in the district, returned from his Indian command. He was still young in years, as we count age, but a grave, silent man, who seemed to live in the shadow of a cloud. By-and-by he married a lady who, it was an open secret, had thrown away her youth in waiting for him. Poor woman! she did not enjoy her late-found happiness long, for in two years she was lying in the family vault, and Eustace went

back to India, leaving his little son to grow up in Aunt Jessie's charge. He never returned home, falling at the head of a volunteer company in one of the desperate fights which left undying glory upon the history of the dreadful records of 1857, at the beginning of the Indian Mutiny. They said he met his death with a smile upon his face.

His son grew to manhood in Aunt Jessie's charge. She did her work well. A capable woman, she did her best to pull things together, although her father's extravagances had almost brought the family to ruin. Eustace had enjoyed a large income in India—those were the days of the pagoda-tree—but the money he sent home, carefully as she administered it, only sufficed to stave off the inevitable collapse. It was not until those supplies had ceased that the devoted woman understood her own and her nephew's position.

Directing her whole energies to the estate, by the time her boy came of age she had succeeded, in a measure, in making things run more smoothly. But there is always the unexpected to be reckoned with, and in Ireland it is always the unexpected that happens. Troublous times were upon the distressful country. Rebellion against existing land-laws was rife. Eustace had never been a hard landlord; but the older generation had left evil seeds behind, for which their successors must pay.

Myles Vandaleur went into the army, and left matters very much in the hands of his capable aunt. He married, but in five years was back at Castle Clare, a widower with two children, and heart-broken by the loss of his wife. Miss Jessie was an old woman now; but, old as she was, she did not shrink from her duty. Her nephew had no heart for the work of managing his estate or conciliating his tenants. Times were growing out of joint. Matters in the wild county grew worse and worse. While Myles Vandaleur was still young in his possessions Clare Castle was burned over his head, the domestic offices only being left intact. Florence barely remembered the catastrophe; over her childhood and early girlhood clouds gathered thickly. Land-laws cut down an income already deeply embarrassed; heavy mortgages dating back to the days of the 'Bad Vandaleur' still weighted them down.

The climax came when Colonel Vandaleur was shot in a scuffle with Moonlighters, and upon Miss Jessie, now an aged woman, fell once more the burden of managing the estate for a minor. She did her work well. She kept things in hand until Myles the second came of age. Gladly had she sacrificed her own fortune to give both grand-nephew and niece a sound education. That the young man had not done very brilliantly in college or acquired some profession by which he could add to his diminishing fortunes had been a disappointment; but then the lad was such a gentleman, so infinitely superior to other young men in the neighbourhood of Castle Clare, that Miss Vandaleur was fain to be content. He was a visionary, they said, but then he had ideals, and for all his exceptional culture he set his hand to the work which he found put into it, and did it with goodwill; he became an enterprising farmer, cultivating the small portion of land left in his possession with fair success. Moreover, he had in him a something which held him above those lower temptations that so often prove pitfalls in the career of youths of his class.

It was scarcely half a year since the beloved aunt closed her tired eyes upon a world which had changed completely during her hundred years of life. She had seen four generations, and the youngest of them all was perhaps the dearest, for Florence Vandaleur's sake.

Now the girl sighed as she looked round the room, her eyes resting last upon a portrait of Eustace, her grandfather, which her aunt had prized above all her other possessions. It was only a slight thing, but it came from a master-hand, being the work of a celebrated French artist done in the dawn of his career. A crayon sketch of a handsome young man in the dress of the late twenties of the last century, it held you by its life-likeness and by the power it possessed. It was the only one of her aunt's relics which she had suffered to remain in its place. Hitherto she had not touched any, since the least of them had been sanctified by death. By-and-by, perhaps, she might look through them carefully—those old letters, the faded diaries, which she left unread. Perhaps it would be as well for her to examine these old records. It would not be prying into secrets wisely kept from her while she was too young to understand them. Now that she had in a manner stepped into her aunt's place, it was only right that she should become acquainted with the story of her family.

She descended the stairs and went out into the pure, sweet evening air, her thoughts naturally turning from the past to the present, and the arrival of this unknown guest. What was his object in coming amongst them? Could there be anything behind? If so, what was the nature of the mystery? Even as the thought shaped itself in her mind she was aware of voices that sounded strange. Myles must have brought his guest through the gateway and the courtyard flanked on one side by the scorched masonry of the old house. Once that fine façade had contained the entrance to the great hall and the splendid rooms opening to right and left. She caught her breath. Had the sun dazzled her eyes? Because a woman, a girl of her own age, was advancing towards her at her brother's side, a girl with so bright a smile on her face as to

make the Irish girl feel at once that she had found a friend.

'Florence,' said her brother, and his voice was vibrant, 'this is Miss Cecil Lavine.'

It seemed as if his further speech was unnecessary, for the startling stranger spoke for herself. 'Yes, indeed, Miss Vandaleur, I'm the genuine Cecil Lavine, and no humbug, as I had to convince your good brother when I stepped out of the car. He did look amazed—thought I was a ghost or an impostor; but I knew how the mistake had arisen, and I wasn't taken aback by his reception. I knew he believed me to be a man all along—I do write a masculine hand—and therefore promised myself a bit of a joke. I knew the welcome he promised his strange correspondent from "my sister and myself" didn't involve any question of sex, so I came along.'

Her voice was soft and silvery; there was a ring of piquancy in it as she related her story; also, Florence found something strangely fascinating in the bright face and dainty figure. It seemed to her that this brilliant vision had come to them out of the remote past, yet all about her was fresh and new. Her bright eyes appeared to take in the whole position; her vivid smile filled up every gap in her swift speech. By the time she had ended, Florence had led her into the drawing-room and rang for Cathy and tea.

'I cannot tell you how welcome you are,' she said. 'It is a relief to me to find our visitor one of my own sex, instead of'——

'A lean, business-like Yankee—I know the sort—intent upon trade,' she said, with such a pretty little gesture as she spoke. 'When father suggested my sending his Dublin man of business to look up some old curios he longs to possess, I just wired to say I would do the errand myself.—You see, I wanted to know Ireland from within,' she added, turning to Myles. 'There are at least a dozen operatives from the Clare district working in father's yards. I talk to them all—we make it a point to encourage our hands—and they just rave about their native place.'

'I know that many of our former tenants have crossed the Atlantic,' Myles said; 'but, as most of them left because they refused to pay their rent, I thought they carried no good or pleasant memories of the old country away with them.'

'They positively adore it, and they never tire of telling old stories about this place and the Vandaleur family.' She blushed prettily as she spoke. 'There is the dearest old man who comes to talk with father every Sunday. He was once — oh, seventy years ago—page-boy here, while his father was butler, I think. He must be as old as my father, who is eighty-seven.'

'Your father?' Myles cried incredulously.

'Oh yes; he was over sixty when he married, and I am his youngest child; my brother died,' she answered simply, 'and I am my father's secretary and his pet, although I say it. I have been wandering about Europe for nearly a year, so I must get back to him soon—just as soon as I'—— She blushed again. 'We will talk about business to-morrow,' she said.

CHAPTER III.

MYLES VANDALEUR spent that whole evening like a man in a dream; but as he talked with his friend after dinner, Stephen's condition became almost as confused. While his host enlarged upon his sensations of amazement when he saw the dainty figure step out of the railway carriage the doctor was pondering over certain vague memories which the recent events had aroused in his brain; they had been troubling him ever since this question of a guest from America started into their quiet life.

Ostensibly, this visitor was coming to look for curios. Was it a mere collector's enthusiasm, or had the seeker another ulterior object in view? A childish memory haunted him: old men talking, wagging gray heads over a dinner-table spread with decanters and bright glasses, secrets in the Vandaleur family. Some catastrophe—he scarcely knew its nature—had occurred. Half-sentences uttered, lowered voices, a curse upon the Vandaleurs. Just old men talking with his father in the Dublin home, left desolate years ago, and he himself a little boy supposed to be asleep upon the sofa. They were telling his father something; papers had passed from hand to hand.

But, secret or no secret, this unexpected messenger was perfectly charming. And what a relief the surprise of her sex had been to him! No stranger laden with unwelcome dollars was to discover the treasure amongst women on whom he had set his heart long ago. Soon he might be in a position to speak, and meanwhile here was Myles talking his best to the fair visitor, and she was making reply. She had devoutly wished to see Ireland from within. She had Irish blood in her. No, she did not quite know from which side it came. She had made friends with Florence already. She played for them, as brilliant in her execution as her talk, but Stephen preferred the quiet style that went straight to your heart.

Myles sat entranced. The stranger had a wide acquaintance with the greater world; Continental cities were familiar to her. The young man felt as if some book were opened to him from which he could learn wonderful things.

'I like your doctor,' Miss Lavine said when

Florence showed her to her room at bedtime. 'He seems quite a superior sort.'

'He is, and he is about the most intimate friend we have,' Florence returned. 'We have known him since we played together as children.'

'Ah yes, you don't live in a hurry here,' Cecil said meditatively. 'You have time to let friendships ripen; we are always on the rush. Now, I have not a real close friend except father. Acquaintances? Yes, scores and scores; but somehow there are no close intimacies amongst them. I never was at school or college like others girls. Father kept me with him. I had teachers of all sorts, and I liked some of them—the dear thing who travels about with me best of all. She is in Dublin, poking into picture-galleries and museums, and going round on the top of trams, which things she loves. She's Irish too.'

The girl was standing in front of the fire, which a touch of frost in the air made necessary. As she stood she looked up suddenly and gave a little start. 'That picture?' she asked quickly. 'I had not noticed it before.'

'My grandfather, Eustace Vandaleur,' Florence said, as she also looked up. 'I believe it was taken when he was a student in Paris. We like it so much! My old aunt, whose room this used to be, prized it above all her possessions.'

The girl was looking steadily at the face upon which the lamplight fell strongly. There came a curious expression into her deep eyes, a tightening of the nerves about her lips. 'It is a very fine sketch,' she said guardedly, and turned away.

That night Florence dreamed a dream. Her aunt stood by her and pointed to the old writing-desk which had been carried into a corner of the girl's small room. Florence could see the dear old face, with moving lips and eyes full of expression; but no words reached her ears, although the eager look in the kind old eyes was full of an unknown meaning.

With day the dreams depart. Florence had her hands full for the next few days.

Their guest appeared to have forgotten her errand, and merely to be eager to acquaint herself with her surroundings. Therefore sundry expeditions were organised, Dr Browne lending ready help with all. His small yacht was at their service; and, with the owner at the helm, they explored the beautiful shores of the lough, even venturing through the narrow mouth into the open sea. And a scratch team, made up out of the stable at Clare and the doctor's steady horses, was attached to the old drag, so that the inland views could be visited. Of course, the guest's place was on the box; and as she watched Myles's strong hand upon the reins a new aspect of his character presented itself to her. She began to understand the amount of reserved power there was underlying the quiet grace of his manner and his apparent way of taking life easy. These were days to remember, days when the imagination had full sway, days to brighten eyes already too bright for one man's peace of mind, days of beauty, and the beginnings of many things. Verily Miss Lavine had her wish—she was acquainting herself with Ireland from within.

She talked freely about herself to Florence, frankly admitting that she possessed much which her own father, with all his wealth, could not buy. 'And you have had these things all your life long—your traditions, your atmosphere,' she said. 'It is all so much a part of yourself that you can't understand what it is to be without them. I may be talking great nonsense, but I do envy you all I can't possibly attain.'

'You must have Irish blood in you,' laughed Florence. 'Now, suppose we don't waste this morning, which isn't very promising, but take a look at those old cabinets that lie in the harness-room. Myles won't return from the fair until luncheon-time. Do you object?'

'What a happy thought!' cried the girl. 'Let us go at once.' She went to her room for a moment, opened her writing-case, and read from a letter written in a crabbed hand: 'Look for an old marquetry cabinet, very highly decorated, with a coat-of-arms wrought into the pattern. The shield bears three chevrons, light upon a dark ground; the crest is a hand grasping a wreath of olive-leaves, the motto "*Si je puis.*" Get it from them at any price they choose to name.'

She stood looking at the words with a contraction on her brows, her lips very tightly drawn together. When she decided upon doing her father's errand in person it was with the fixed idea that these broken-down aristocrats would be only too glad to make as much as they could out of their old curios. A very different aspect of things now presented itself to her. She had never been brought into close contact with such natures as these in all her crowded life: Florence with a soul of such transparent beauty, and Myles the open-handed gentleman whose every touch ennobled the common tasks he performed so well. There was about them both that atmosphere of which she spoke to the sister. It seemed to claim a closer friendship than she had yet so much as dreamed of in her inmost soul; it was something that held her back—that almost sickened her—when she thought of offering them money for the article she had come all this way to secure. Anything they chose to ask! But were they likely to name a price, and she—could she venture to suggest one? She looked up at the picture on the wall. 'If you could but speak,' she said aloud. 'But you seem to be the most puzzling part of it. Heigh-ho! I

do wish I had allowed an outsider to manage this business!'

But in a few moments she was laughing with Florence as they crossed the courtyard, telling her how much she would have liked to accompany Myles to another fair, if such a thing took place in the neighbourhood again. 'I saw he meant business this morning, therefore didn't suggest such a thing,' she added. 'Women are in the way when there is work on hand.'

Here they were in the big harness-room, with Tomsey and his assistants showing off the old cabinets, bureaus, carved tables, sofas, Sheraton chairs, which had been rescued from destruction. Damaged they certainly were, but none of them too far gone for restoration. Cecil said so. 'I have often gone curio-hunting before now,' she cried, 'and I know what I am about. Oh, this is the gem of the whole collection!'

For Tomsey had kept the best to the last. It was the old marquetry cabinet. She looked at it with dilating eyes. There was the coat-of-arms wrought in the decoration, the hand grasping the olive-wreath, the motto. There could be no mistake about it, and her heart began to beat.

Florence examined the beautiful bit of eighteenth-century workmanship with unfeigned admiration. 'You will be amazed to hear me tell you that I had no idea we had such a thing in our possession,' she said.

'It is very beautiful, and very valuable.' Cecil was almost breathless as she spoke. How had her father come to know of this rare old treasure, and was it the mere collector's desire that made him so eager to secure it? The thought perplexed her.

Florence felt deeply embarrassed. She was remembering how she had advised her brother to make a little money out of the old things crumbling to decay in an outhouse. Her feelings had changed most strangely within the last few days. How could she ask him to receive money from the hands of this new friend who had flown to them from unknown lands like some strange and beautiful bird, bringing along with her so much that was out of the common and sweet and new? Her heart beat heavily. Something rose in her throat.

But speech was saved her, because at this moment there was the sound of a horse's feet on the pavement, while her brother's ringing voice broke the silence and echoed through the yard. 'Hey, Tomsey, Tomsey!' it cried. The old man hastened to meet his master, and had Florence not been occupied with her own feelings she might have seen a deeper colour rise to her companion's cheeks.

He came into the harness-room, bringing along with him a sense of strong vitality, of power, and of the open air. His eyes were bright; his lips wore a happy smile. 'What! poking amongst these old chattels?' he said, and his voice was good to hear. 'Are you pleased with the rubbish?' he asked most cheerily. 'What! call that magnificent?' He glanced at the old cabinet. 'I can't see anything wonderful about it. Do you?'

'It is quite the most beautiful example of its kind I have ever seen,' she answered, with a heightened colour. 'It is most valuable,' she went on, with the air of one who understood what she said.

'Ha, ha!' he laughed. 'But, you see, I haven't been educated up to that sort of art,' he said.—'Well, Flo, what's your opinion?'

It was hard for her to reply; her quick intuitions caused her to wonder if she could actually define the knowledge which had burst upon her like a thunder-clap. The new thought caught her breath and well-nigh choked her. Her brother's eyes were on the stranger's face devouringly. Fie! was she about to turn into a jealous woman? 'Like yourself, I don't feel able to judge,' she faltered, two thoughts mingling in her brain.

He scarcely heard her, having turned to his guest. 'Will you try my favourite mount, Miss Lavine?' he said eagerly. 'He will carry you like an angel.'

'I have heard of angels on horseback,' she returned gaily; 'but they were not young women, who must have a proper riding-dress in which to take their flights.'

'Florence can lend you a habit,' he insisted.

How eager he was! How intent upon giving her pleasure! The new thought was painful, but the girl thrust it aside. 'You are welcome to anything I possess,' she said to her guest.

But it was her brother who thanked her most warmly. 'Let us have luncheon and be off,' he cried as they crossed the yard. His handsome face was all aglow; his eyes shone. The cloud seemed lifted from him, and Florence felt a doubtful joy. What might come of it?

'You are all far too kind to me.' The girls were together in the visitor's room, and Florence was helping Cecil to don the borrowed habit. 'You are most certainly the dearest and the very, very best—yes, just the very, very best people I ever met, the kindest and the most confiding. Here I drop down amongst you out of the Anywhere, and you receive me like an old friend; you make me feel as if I—well, not as if I had known you all my life, but as if I had wanted to. Perhaps I have, without knowing it. You never so much as doubted my good faith, never asked a question about me, but just accepted me at sight and upon my own word.' The girl's face had flushed up as she spoke. 'I might have been a brutal impostor of an adventuress, or anything horrid.'

'We could easily see what you were,' Florence said gently. 'You bore your character upon your face.'

'But you should never trust to seeming,' Cecil laughed. 'Appearances are deceitful, you know. Why didn't you write to our Consul about me? He could have told you everything. Your friend the doctor was wiser. He did write.'

Florence looked up from her task, a pained expression in her eyes. 'I could not have believed it of him,' she said. 'Write to make inquiries about you? It was dreadful!'

Cecil laughed her ringing laugh that was so good to hear. 'He is the only man of the world of the whole lot, and he did the right and allowable thing. He found that I was perfectly correct, and therefore my friendship with *you* was a thing not to be discouraged.'

'But it is so unlike Dr Browne. He is not suspicious,' Florence faltered.

'This time he showed his wisdom. He heard everything you can hear this moment for the asking.'

'I know quite enough about you,' the girl said, lifting soft eyes to the bright face bent above her. 'How could I have the heart to question a word you said? I believed you the moment I heard your voice.'

'Well, Dr Browne wrote to our Consul in Dublin—a dear man; I know him well—old friend of father's. My dear Blinkie—I mean Miss Blinkley, my friend who looks after my wanderings—is staying with him and his nice wife at the present moment. It was quite right of your friend to inquire about me. I like him all the better for it. Shows he's a trustworthy man, that young doctor, with a little more knowledge of the world than—— Well, it's all so fresh and new to me that I can't help just loving it.'

She stooped and kissed Florence's fair face as she tripped out of the room and downstairs to the courtyard, where Grayling stood, with Tomsey at his head, a beautiful creature, with mild eyes and a soul of fire.

Myles tossed the girl lightly on to Grayling's back, and, with a wave of his hand to his sister, they rode away rein to rein.

CHAPTER IV.

FLORENCE had her household duties to look after, which happily left her no time for brooding thought. Nevertheless, as she went to and fro in the garden and the lower rooms, that troublesome, vague outline of Something took shape and form. She had been all in all to her brother. Myles was a stainless knight who had never offered homage at any alien shrine. Was she to lose her place now, and see another enthroned therein? And, again, why had Dr Browne troubled himself about their visitor?

That visitor had said something that sounded like a suggestion. He had inquired about this stranger—on her account, was it? Had he indeed such care for her? Surely only because they were very old friends. Also, Myles and he—— She caught herself blushing furiously amongst the apple-trees, the gnarled, moss-grown trees which had sheltered the childhood of so many generations of Vandaleurs—blushed hot and red as she pursued home that thread of fancy. Stephen Browne! Did the name mean more to her than she thought? Had she suddenly come to the knowledge of something that had never taken actual form in her mind before? These things troubled one's life overmuch; it was best to put them far into the background, and only occupy one's self with the trifling matters of every day, with the apple-tart for dinner and the flowers for the dinner-table. Ah! Myles was to live his life apart from her. It was only natural. Blinking away the tears which had sprung unbidden to her eyes, she filled her hands with the fair autumn chrysanthemums which grew on the outskirts of the orchard. Men must choose for themselves, live their own lives. It was for women to wait and work. She was her usual fair, composed self when she went back to the house.

Through the dreamy autumn day, under misty skies, rein to rein, those two rode into an enchanted land. The soft pearly mists that lay amongst the hills added height and mystery to the rugged clefts and towering peaks of the mountains guarding the blue lough winding in and out amongst them. Is spring really the time when 'a young man's fancy' leaps into love? A great poet has told us so, at the same time qualifying his statement with the word 'lightly;' but there is something in the wistful, yearning beauty of autumn which appeals forcibly to the stronger feelings of a deeper nature and a craving heart. Myles Vandaleur's life had been lived in shadow; to him the lighter flights of fancy had been practically unknown. He had always regarded the very fact of his existence as a solemn responsibility, a burden to be carefully borne. Now, for the first time, he felt the presence of a woman to be sweet, felt that a new and precious thing had come to him, and would abide, even when the sweet individuality which had evoked the new bewildering emotion was taken from him for ever.

'Who ever loved that loved not at first sight?' asks the great genius who best understood humanity at large. From that moment of dazed surprise, when he saw, instead of the lean Yankee man whom he had gone to meet,

a lovely vision of sparkling eyes, red lips, and blushing cheeks step out upon the tumble-down railway platform, an amazing change had passed upon him. He knew he had come face to face with Fate. It was sheer madness of folly, of course, but his fate all the same. Now, as they rode through those dreamy solitudes, the impulse to tell her so became almost too powerful to be resisted.

'We don't get these lights and shadows in our country,' Cecil said, as a pearly mist, tenderly touched by the westering sun, floated slowly from a rugged peak and dissolved into tiny iridescent wisps of vapour in the fathomless blue above. 'Our light is too hard and clear-cut for all those lovely effects. I think your Irish character is like your skies—always producing new varieties: it's in your voices. I never heard any one with so lovely a voice as your sister. It seems created to say the sweetest things. I can't fancy its being able to take an ugly tone. Isn't it just an index of her character?'

'Florence is a very dear girl,' he returned. 'Life has been rather hard upon her. She spent most of it taking care of our old great-aunt'——

'I know—Miss Jessie,' Cecil cried. She blushed furiously the moment the words passed her lips. 'My knowledge of your family must surprise you,' she went on hastily. 'I liked talking to that old mummy who had been your grandfather's page-boy. He told me whole histories about you—was never tired of it, you know. It was because of all I had heard from him that I got papa to let me come.' Again her face flushed. Her errand had taken such a new aspect during these latter days that she felt covered with confusion the moment she approached the subject.

'We interested you, then?' Myles said, almost biting his tongue to keep it quiet.

'Certainly you did. Everything Irish interests me.' She was looking away towards the mountains, her face averted. 'We are Irish, my father says,' she added. 'Shall we get on a bit?' She spoke hastily. 'I should like to see what is behind that hill.'

So they rode on. Myles remarked, with an added thrill, how well she sat the beautiful gray, how her fingers almost caressed the reins as they curved over them, and how her lithe figure swayed to the springing motion of her beautiful steed. The sunlight, too, caught in the mazes of her lustrous hair and turned it to glittering gold. If ever ardent Irishman was fairly in the toils, tangled in a maze there was no escaping, it was this beggared descendant of a great race.

That evening Florence played her best. The atmosphere was charged with electrical forces, and the sense of something altogether unexpected filled her with a yearning to express herself that spoke in her music; a deeper, newer self awoke in her being. The old rector, who was their guest, sat by the piano, with wet eyes; while Dr Browne, leaning against the mantelshelf, and talking fitfully to Miss Lavine, was conscious of sweeter meanings and a fuller grasp on life in the playing of the woman whom he had silently loved for many a quiet day.

Could this condition of things last?

Cecil was just her bright, sparkling self when they met at the breakfast-table next morning. Yet underlying her vivacity was a certain sense of uneasiness. The unexpected had occurred. She must fly before matters reached a crisis which might damage a friendship she wished to be enduring. Suppose her host defined what was still vague and unreal? Her father? Her own heart? These two factors in her fate must be thoroughly understood before she made a step either way. Yet, lying awake, with the flickering firelight dancing on the walls, and now and then a glimpse of that tantalising old portrait which had been a wonder and a mystery to her ever since she came to the house, she knew that in Myles Vandaleur she had encountered the very first man who had ever touched her deeper self. Proposals—admirers? Oh yes, she had had them by the dozen; but this! Well, there was something very different in the man: his surroundings, his story, and also—the most inexplicable interest she had always taken in the fate of a great family fallen from its high estate, ruined, beggared almost. She, the heiress of a man who counted his dollars by the million! How powerless those coins were to purchase that which these people possessed: tradition, pride of race. That face, with its haunting eyes, looked upon her through the uncertain light. She sat up in bed and almost uttered a cry.

It was sweet upon the dancing waters of the lough. Dr Browne, as usual, sat with his hand upon the tiller and his eyes returning to the quiet face of Florence as she sat a little apart—dreaming. Dared he for one moment hope it was of him?

But she was thinking of her brother, and of the problem she was called upon to face; for she knew fully—knew and understood—the complications which had arisen. There must be no traffic with the girl whom her brother loved. Questions of hard cash dared not be so much as mentioned between them. She knew what she would do. If Cecil really wished to possess that cabinet, let it be as a memorial of a visit so fraught with meaning to them all. Touch her money? Never—never! The hateful subject must not be so much as named amongst them, for Cecil's sake as well as their own. Drift, white boat; drift into dreamland—fairyland; shine down, misty sun of late September! The fair, strange bird that had flown to them would go back to her unknown land and leave

memories behind to sweeten the long, wet winter that was to come, quiet talks for long dreary evenings when winds were loose upon the lough and the rain was on the roof. Ah, but her brother! what would his life be when this new delight was taken out of it?

That evening they dined at the doctor's cottage, and floated home by the light of a great golden moon. Cecil's bright eyes took in all the details of that pretty bachelor establishment. 'Florence will make it a little Paradise for him,' she thought, 'when I am far away;' and she sighed.

Myles noted the sigh. He thought of it while he lay sleepless until the moon went down. Oh, if this condition of things could last for ever! Fool! the end was upon him before he knew.

They had planned another expedition for the morrow; but the day brought its own evil, its unexpected blow. First of all, it was a lowering, gloomy morning. Tomsey said there would be thunder before the tide turned. A low, moaning wind was shaking down the leaves in the orchard and tossing the flowers roughly to and fro.

'Too rough a day for the lough,' Myles said as Cecil entered the dining-room. 'We are blessed with a fickle climate in this part of the world, Miss Lavine.'

She made some slight remark, and then, 'It has been so lovely that I should have liked to keep the sunshine with me all the time,' she went on; 'but I have a sort of impression upon me that I must get back into the hurly-burly, back to busy life, because this is Lotus Land. You begin to forget that there is a big, busy life outside it all.'

'We don't forget what we have never known,' Florence said gently. 'But you belong to the great world. It claims you.'

Cecil gave her pretty shoulders a little shrug. 'I wish it didn't,' she said. 'I think this quiet existence claims me most. It is so new, so fresh.'

'The newness would wear out, the freshness fade, if you had too much of it,' Florence returned as she poured out the coffee. 'Better carry away with you, when you leave, the impression of its beauty and novelty at its best. If to-day looks gloomy, let us hope that to-morrow will bring back the sun. That's our Irish way.'

'All your Irish ways are like your skies—full of unexpected rainbows. Oh, is that a telegram? With us, on the other side, they are so common as not to give one a moment's thought; here they may seem out of place. What with telephones and telegrams and rush and hustle, life at home grows intolerable sometimes. Here you can rest.—Is that yellow thing for me, Mr Vandaleur?'

He gave it to her with a sick sinking at heart, and watched her fair fingers as they ripped it open. His eyes went to her face. He saw it flush, then pale, while her eyes dilated. She looked up at him with almost fear in her face. 'I am wanted in Dublin city to-night!' she faltered.

The unexpected had arrived, the blow fallen. With day the dreams depart.

CHAPTER V.

SHE had gone! Except by the pallor of his face, the tremor in his voice as he bade her good-bye, he had not betrayed himself. And was she glad or sorry?

'We are bound to meet again,' she cried eagerly, as she leaned from the carriage-window with shining eyes. 'Oh yes, we must. It has all been so lovely, so perfect! Give Florence my love over and over again.'

The rickety carriages glided away from the mean little station, and he was left alone. But his mind was made up. He would see her once more before she finally turned her back upon Ireland. And she had admired that old cabinet; it was hers; it must go to her at once. He would follow later.

Slowly the creaking carriages glided through the vacant spaces of the lonely land lying between the Irish metropolis and the sea—moorland, over which a dismal rain fell wearily; dim mountains, looming gray and cold through the mist; a sense of utter desolation and abandonment. The girl, who sat alone in the dingy first-class carriage, began to realise the fact that she was crying. She told herself she was a mean little fool. Ten days ago she had passed through the same scenery light of heart and somewhat arrogant in her pride of unfettered youth. Now some spell had fallen upon her, some strange thing that was mingled curiously with sweet and bitter. Those ten days had given her these new sensations for a legacy. Ten days! Had she made a fool of herself? She had seen the very article which her father had sent her to seek, and she had not so much as made an offer for it! What would the old man think of her folly? Would he understand her scruples? On and on. The scenery altered. In the twilight she could see far-spreading woods and stretches of cultivation. She knew she was approaching the capital and whatever awaited her there. She had been bidden to go direct to a certain hotel. A carriage was to meet her at the terminus. Had Blinkie been acting under orders? Some important change must have taken place in her father's plans.

Darkness now, with fewer stoppings at wayside stations, and the train rushed on at in-

creased speed. Whatever was waiting for her in Dublin, she realised that Castle Clare and the Vandaleurs were altogether left behind.

The carriage went swiftly through dingy streets, where the white glare of the electric light illuminated only squalor and decay; then it rattled upon hard pavements, and at last here was the hotel, brilliant with light. The carriage halted at the door. There were some people standing about in the vestibule—chiefly men. No trace of Blinkie. But she was a young woman with a well-balanced mind, and one to whom hotels were familiar. Therefore she walked into the warmth and glow, bowing attendants to right and left. 'Upstairs, madam,' said a gorgeous being in green-and-gold. It seemed as if only a moment afterwards she was in her father's arms.

'Papa!' Her quick, sobbing exclamation made the noble old man strain his only child closer to his heart. 'Oh papa, how did you come?' she gasped, drawing back from his embrace to look into his fine old face.

'By the *Cymric* to Queenstown, and the rest of the way in the mail,' he answered with a pleasant smile. Verily this girl of his, the child of his old age, was worth crossing the Atlantic to embrace.

'But you know, you naughty old man, that isn't at all that I mean,' she cried, feeling as if some tension in her brain had given way. 'I want to know why you are here.'

'Business, business,' he said quickly. 'Now, off and get ready for dinner. No talk until we have settled that question.'

There was none. Miss Blinkley, a dear old soul, with merry blue eyes under her white hair, made matters go smoothly, for to the girl's keen sensibilities there seemed to be a weight in the air.

Father and daughter were alone. His face had turned hard and set.

'Are you too tired to give an account of yourself?' he asked quickly.

She was looking at him with an added interest. The familiar face—the face she had loved from the dimness of her earliest recollections until this day—had suddenly acquired a new meaning for her, a meaning she could not trace home to its source.

'I am not at all tired,' she returned quickly. 'I have much to tell.'

'I expect so. You found what I bade you find?' His eyes scrutinised her closely.

She returned his look with one that puzzled him. 'Yes,' she said, 'and a great deal more.'

'What more?'

'It will take long to tell,' she answered with a catch in her voice. 'They are quite lovely people.'

'What people?' he inquired sharply.

'The Vandaleurs—a new type to me.'

'How many are there? They were never people with large families.'

'You appear to know a great deal about them, father.'

'Hum! Possibly. But you have not answered me.'

'There are only two. Quite young, not older than I am myself, and—like no other people in the world.'

'That's a large order. Sisters?'

'Brother and sister. They live in a corner of the splendid house that was burned down some twenty years ago. Such a sweet place! They are like people in a book—quite out-of-the-world folks, surrounded with old memories and traditions, an atmosphere I have never breathed before, father.'

'Ha! they appear to have fascinated you, Cecil. Now, about that cabinet. You found it? Is it broken up?'

'Quite perfect; a very little repair would make it a sight for the world.'

'Have you brought it along?'

The crisis had come. She must face it out. 'No, father,' she said steadily.

His face darkened. 'They would not part with it?' he asked in an altered tone. 'Asked too much? I gave you unlimited power to trade with them.'

'They are not people with whom you could "trade," father,' she replied, her voice echoing the hardness in his own.

'Folly! You can trade with the best. Did you make them an offer?'

'No,' she said steadily. 'I could not. They would not have listened to me. Money has no value in their eyes.'

'Such nonsense! Money means far too much to them—the want of it at least—unless I have been misinformed.' He started from his seat and began to pace the floor. 'I never expected this of you, Cecil,' he said, pausing in front of her. 'Had I thought you could be so—so—blinded by romantic scruples as to disobey me in what is a matter of the greatest moment to me I would not have suffered you to go west. I would have sent Flickers; he would not have been led from the path of duty by any such folly. He shall go down there and do what you have left undone.'

'No, father, you shall not do anything of the kind,' she said, grasping his arm with a tender clasp he could not thrust aside. 'No; I could not bear it. Florence'——

'Ah, the sister, I suppose, although the name is new in the family. Well, what of her?'

'She is a woman in a thousand.'

'And the brother, is he also of that description?' The old man suffered a suspicion of a sneer to vibrate in his voice as he spoke.

'Mr Myles Vandaleur is a high-souled gentleman,' she replied, striving to keep down the sense of hot anger that caught her throat.

[*Christmas Number.*

She had never felt angry with her father in all her life until now.

His eyes scrutinised her face. 'So,' he said, 'you went out for wool, and came back shorn?'

'If to come back from the wilds with the knowledge that money is powerless—powerless to procure the best things in life—means to be shorn of false views of it, then I do acknowledge that I have lost many of my ideas during my stay in the west,' Cecil answered. 'I have learned much. Oh father'—she put out her hands to him—'father, the gifts of God are not on free sale! You cannot trade in them, and one of them is happiness.'

There was a brooding suspicion in the look which he turned upon her. 'You are a romantic girl,' he said. 'I suppose it's the blood stirring in you. Go to bed and sleep. We 'll talk about this to-morrow.'

Her pillow was wet with tears before sleep came to bring back to her mind the mysterious portrait in that peaceful room which somehow seemed Home. Early in the morning she wrote a line to Florence. She could write words that would not shape themselves upon her tongue. Her father wanted that cabinet. Some matter of deep importance underlay what she had all along considered a mere whim.

They conversed lightly at breakfast. Her father told her there were many things to be seen in the Irish capital which she must inspect before they left, and the evening and the morning made a pleasant day; but the girl felt she was treading upon volcanic forces. He never mentioned the Vandaleurs to her; as little did she speak to him of her letter to her new friend.

When they returned to the hotel and dinner, the superb being in green-and-gold had a word to say. 'A large package has arrived for you, madam.' His disciplined voice was suave and unctuous. 'It is in the trunk-room, too large to be carried upstairs without orders.'

Her heart leaped. She had left nothing behind at Clare, and what did this package mean but that Myles—— Her face crimsoned; even the hall-porter saw the swift access of colour. 'If you order it, madam, I will see that the parcel is carried to your room,' he said, being sympathetic.

She heard her own voice giving the desired command.

Not only did the men carry the carefully packed parcel to her room, but at a word they removed the matting enfolding it. She gave a little cry.

'So they sent it on after you, I suppose as a gift?' Her father's eyes were glittering; his mouth twitched. He gloated over the beautiful cabinet, but not with the eyes of a connoisseur. There was a hunger in his face which his child wondered to see. He had grown eager—hard —craving—over this unexpected fulfilment of his desire. He scarcely glanced at the note his daughter put into his hands; he only saw that the envelope contained a key. The girl drew her breath hard. That haunting mystery which had enveloped her ever since she set foot in Castle Clare, and which had been one of its main attractions for her, was about to be explained. This cabinet contained a treasure which her father wanted with some strong purpose which she could not understand. The mere beauty of the thing could not account for the passion that was in his face.

He had turned the key with difficulty, for the old lock was rusted. Apparently he had utterly forgotten his child and the note which had rustled to his feet. His face was ashen pale; his eyes glittered with a rapacious light she did not know. The cabinet was as beautiful within as it was to the outward eye; there were infinities of little drawers and cupboards, fit for a fairy's use, that opened at a touch. Eagerly —the old hands trembling at the task—Lavine searched amongst them for some hidden spring, perhaps some hiding-place lying unsuspected amongst the rich ornamentation of an almost priceless gem of a lost art. At last he uttered a cry. Its anguish brought her to his side, to save him from a heavy fall. He had found the hiding-place for which he sought. Empty!

CHAPTER VI.

WAS it only the moaning wind, the dreary swirl of falling leaves, and the autumnal chill which crept upon her that made Florence feel her home so deserted? She had often heard the wind sob and moan through the scorched ruins of her ancestral home; but now there was a pitiful plaint in its tone to which she must listen in spite of herself. Happily, there was work to be done. Aunt Jessie's dear old room must be made like its usual self, the ancient treasures returned to their accustomed place. When Myles came back she must be prepared to meet him with a smiling face. Because, if she, the sister, felt that their strange visitant had carried away with her something sweet and bewildering, which left a sense of want and loss behind, what must the brother's keener feeling be? She felt no touch of sisterly jealousy now, only an enormous sympathy for the pain she knew had come to abide with him. The delicate sympathy existing between them taught her much.

She busied herself with those old packages, opening one after another with tender hands. It was as if she touched the garment of the dead as she unfolded one after another parcels of delicate lace and embroidery, old cardboard boxes tied up with faded, frayed ribbons—things

she had looked upon with awe in her childish days. They were her own property now, yet they felt sacred. Had not death turned them from chiffons into relics? And her tears fell slowly.

Last of all, she lifted the old brass-bound desk. She remembered her strange dream on the first night in which it had lain in her room. Aunt Jessie had come to tell her—what? She carried it back to its old resting-place; but as she crossed the threshold of the room her foot caught in a fold of carpet; she stumbled; the desk fell from her hands. It reached the ground with a crunching noise. While she steadied herself by the door-frame, making an effort to recover herself, her foot touched it with a certain force. When she stood erect upon her feet once more she saw that the old wood, crumbling away from the brazen clasps which had once secured it, lay in a dusty heap on the floor, which was strewn with a dozen packages of old letters, some quaint antique seals, even a fragment of old sealing-wax, and a little mound of what looked like modern confetti—the wafers with which our ancestors secured those reams of infrequent letters by which they communicated with their friends.

Her hands trembled a little as she picked up and sorted over those records of lives long since passed out into the Great Silence. Dates in a queer, cramped handwriting were inscribed upon several of the bundles; but upon one was written, in a hand she knew, a line which made her heart stand still, for the writing was her father's, and the date within her own short lifetime: 'Papers concerning my father's secret, removed by me from the old marquetry cabinet, November 11th, 188–.' It was the day after the fire—a day which loomed mistily in her memory—she had not emerged from babyhood; but the writing brought back a confused sense of terror, discomfort, loud lamentation. Now she shook like a leaf; her heart throbbed in her throat. The marquetry cabinet!

Cecil Lavine had looked upon that beautiful antique with a strange longing. She had mentioned it that morning, and done it in a furtive, hesitating way. Her grandfather's secret—the grandfather who had died a hero's death fifty years ago! His secret! The package was in her hand—a bulky package, tied with a frayed string. The outside cover was stained as if with wine, or—or—— She closed her eyes and turned sick. This thing dated from the bad old duelling days! Could it be possible there was blood upon her grandfather's hands? Her courage rose as she opened out the parcel, laying the contents upon the table at her side.

They were all franked by a name she had heard her aunt mention. Her great-grandfather, the Bad Vandaleur, as the people still called him, while himself refusing to sit in what he chose to consider an alien Parliament, had yet no scruples as to disposing of his safe seat to a friend. This man's name was on most of the letters.

The first she unfolded sent the blood racing to her heart:

'Dear Van,—Eustace is living in Kensington with the girl's father. She is an elegant little creature. On my soul, the boy has good taste! Her manners are those of the *grande monde*, as I remember it forty years ago in Paris. The old man — her foster-father, or guardian, or whatever he pleases to call himself—and his wife make no pretence of gentility; they are just simple French artisans of the higher class. Of the man's artistic powers you already possess a proof in the beautiful old cabinet he repaired for you, which little job led to the whole of this affair. I interrogated the man as to the birth and ancestry of your son's wife. Her father, the Comte de la Vigny, was killed at Austerlitz, and her mother, who was related to the great house of De Fresnelle, died of a broken heart, leaving this little infant absolutely without provision of any kind except such fragments of old jewellery and furniture as remained in the poor Comtesse's possession. The old man and his wife took the child, and brought her to London, where the man has earned a sufficient maintenance by his work. You happened to purchase the marquetry cabinet, which led to the rest of the little romance, and now my advice to you is, receive Eustace's young wife with open arms. He himself was absent with his regiment when I called. I will be able to tell you more in my next letter.'

Florence read no more. This letter threw a lurid light upon the past which dazzled her bewildered eyes. De la Vigny—where had she recently been familiar with a name resembling it? But her hand was steady as she lifted the second letter. A loose slip of paper was enclosed in it; she saw it flutter to the floor as she unfolded the page. It was less carefully written than the first letter, and began curtly:

'Sir,—To dissipate your doubts, I beg to enclose an attested copy from the Parish Register of St Mary Abbot's Church, in the parish of Kensington. Having thus vindicated the honour of your son and the charming lady who is his wife, I beg to decline any further interference in the matter. Were I within reach of you, old as is our friendship, and vast as are the obligations under which you have placed me, I would instantly demand satisfaction for the insult you have put upon me by so much as naming to me the disgraceful course of action you suggest. I must conclude a

correspondence which has become intolerable to me, and with it a friendship I once most highly valued, but which I find impossible to continue after this date.—I remain, Sir, your obedient servant, PATRICK O'MARA (Bart.).'

She was cold to her very heart now. What crime had her ancestor suggested to the fiery Irish baronet which so excited his wrath? Of course some deed in connection with this. Was it a legal marriage? Could it be? She knew the name of her own grandmother—Lady Mildred Fitzowen — whose father had been Marquis of Claremore—ancestor of the present young man. But she had died nearly fifty years ago, when her own dear father had been only an infant. Florence felt herself wandering in a maze with no clue to an outlet as she stooped and lifted the slip of paper that lay at her feet. Her eyes swam. The throbbing of her heart rang in her ears and almost choked her. The names written upon the rough paper in faded ink stood out before her in letters of flame: 'Eustace Ponsonby Vandaleur—Cecille Marie de la Vigny, commonly called Cecilia Lavine—united in holy matrimony by me, Henry Davis, curate,' and a date—a day in May 1827.

Like one hypnotised she sat staring at the certificate: De la Vigny—Cecille de la Vigny—Cecil Lavine.' A voice in her ears seemed calling her out of space; there was something familiar in it, yet it was remote as if from behind some thick curtain. A warm, heavy hand upon her shoulder, and the voice, now shrilling in her ears, 'Saints abow! Miss Florrie, what's wrong wid you, core o' my heart, me own child? Won't you spake to me, or will I call the doctor, who is below in the drawin'-room waitin' on you?'

She roused herself from the spell that had fallen upon her, and looked into Cathy's kind, frightened face. 'I am not ill. Did you say Dr Browne was in the house? Yes, tell him I am coming.' Her own voice as she uttered the words seemed strange. Mechanically she gathered up the letters and thrust them into her dress. She must take some one into confidence—why not her oldest friend?

She locked the door behind her and went downstairs. The end of all things was at hand. What was she? What was her brother? Were they really Vandaleurs of Castle Clare, or nameless? She thought of her mother, dead before she could remember her loss—of the proud, pure woman who had supposed herself her grandfather's wife. These things were foremost in her mind as she opened the drawing-room door and faced the man who, she felt, could give her at least sympathy. Dazed as were her senses, she noted how he started back as his eyes met her own.

'Florence, you are ill! You'—— He caught her cold hands and held them. 'What has happened? Myles?' He glanced round him. All trace of the bright stranger had vanished from the room, where some pretty things of hers had lain about for the last ten days. 'She has gone. You have found out?' He had both her hands in his. Under other circumstances she would have blushed and trembled at the fiery ardour of his gaze; but now she only felt she had found a friend, one who could perhaps help her to understand the mysteries thronging round her.

'I have found something,' she faltered, gently withdrawing her hands and sinking down upon the sofa by the fire. 'I think you can help me—help us,' she stammered, as she put the papers into his hands. 'Your father knew both my father and grandfather. Did he know anything about—that?' and she pointed to the slip of paper.

Stephen Browne's dark eyes expanded; he bit his lip. 'So it has come to light?' he said, quite as much to himself as to the agitated girl on the sofa. 'Where did you find this, Florence?' and neither of them observed that during the whole of their intimacy this was the first time he had so called her.

'Amongst my aunt Jessie's papers,' she replied. 'Is it true?'

'Quite true that your grandfather married Cecilia Lavine? Yes, this leaves no doubt on the subject.'

'Then it was — suspected — known?' she faltered.

'Suspected—yes; never known until now.' Stephen's voice was curiously hard. He had glanced his eyes rapidly over the letter in which the certificate had been enclosed, and his face darkened. 'My dearest,' he said, scarcely knowing he used the tender term, 'I can tell you many things. I have been worried—for the last ten days, shall we say?—over vague memories of stories heard in my childhood, so much so that I began a search amongst my father and grandfather's old papers, and strange things came to light. My grandfather and your great-grandfather were friends up to a certain period of Vandaleur's career. In fact, my grandfather would have married your dear aunt, although she was some years his senior, but for the old man's interference. That was why she always had an affection for me. Are you able to bear what I have to relate?' He seated himself at her side. 'Florence,' he said, and his voice was eloquent in its melody—'Florence, will you think it strange if I tell you that I feel so personally interested in the history of your family that I claim my part in it? You will grant me that priceless gift, dearest—your people my people, your interests mine? Your sweet life mine, also, to love and cherish until death?'

She trembled like a leaf in the wind. What mysterious and wonderful thing was it that had thus come to her in the hour of her utmost need? What could she do but grasp the hand thus extended to her—the hand which would draw her safely to land when the waters seemed closing over her head? Without a word she let herself go. She was crying quietly in his arms, feeling that here was shelter, rest, security for ever and evermore.

Afterwards, when they could talk quietly, Stephen told her how he had found amongst his old family papers enough to supplement her discoveries. It appeared that after receiving that copy of the marriage certificate old Vandaleur had gone to London and done his dirty work for himself. Having powerful friends in high quarters, he used their influence in procuring a diplomatic post in central India for his son, persuading those in office that his sole object in thus sending his heir into honourable exile was to break off an entanglement which threatened to ruin his career. It was useless for O'Mara, from whose indignant letter to her grandfather the doctor was quoting, to assert the truth about the lady. Indeed, while the negotiations were on foot, the poor girl and her child disappeared; nor could the agonised young husband discover any trace of them, although he spent the best part of a year in the heart-breaking search. In despair, he went to India, where he remained until his father's accidental death recalled him to his native land. In a year he married the lady whom his father had designed for him in his youth. Lady Mildred only survived the birth of her son a few months, and Eustace went back to India, to terminate his broken life by a hero's death.

Meantime the old cabinetmaker had been dead for many years; and his half-brother having taken up his business, O'Mara, with a tenacity that did him credit, clung to the hope that something might be discovered which would clear up the mystery of Mrs Eustace Vandaleur's disappearance. Not for many years did he arrive at anything to throw light upon such a dark place in the family history. It came at last, in the form of a deathbed confession. The half-brother who had taken over the prosperous business of old Henry Vincente was a thorough-paced scoundrel. He confessed that, tempted by the large sum offered by old Vandaleur, he had persuaded the poor young wife, who was ignorant of English laws, that a marriage without the consent of the man's parents was null and void, as she knew it to be in her mother's country. The old man who had been a father to her had become imbecile. She had not a soul to whom she could turn for advice. O'Mara was out of town; evil counsellors were round her, Vandaleur's money working against her. Never a very strong woman, soft, gentle, helpless, she accepted a couple of hundred pounds—five had been the sum paid to her false adviser for the purpose—and with it went to America, hoping to find some relatives in a French settlement; but as the ship in which she sailed was cast away, it was more than probable that she had perished with all on board.

'I have brought with me all the letters I could find,' Stephen said. 'We can go over them carefully when Myles returns. I think it more than probable that this rich man, whose daughter came so mysteriously amongst us, has some reason to believe himself interested in this story. You found the letters endorsed as being found in the marquetry cabinet? You see how that old curio has been mixed up in the story from the first.'

They had not done with the strange discovery when Myles returned from the railway station alone. Even the news they had to tell him of themselves scarcely moved him beyond a perfunctory wishing them every happiness. His thoughts seemed far away. Not until after dinner did Stephen broach the subject which had so filled their minds. At first the infatuated young man lent but a careless ear to the strange news they had to tell; but when it dawned upon him that Cecil Lavine's name was mixed up with their discoveries he at once became interested—excited.

'This must be sifted out to the last,' he said; and they both agreed.

CHAPTER VII.

NOT until the next day did Florence learn that the precious cabinet had followed their bright guest to Dublin. Did it matter much? She had taken with her a far greater treasure, and one less easily replaced—her brother's peace of mind. But she loved the girl. Her fascinations had entangled both brother and sister; and to know their guest was of their own blood only served as a fresh link to bind her to their hearts. But there was still the doubt—also the cruel fact—that if the old father, of whom the bright stranger spoke with so much affection, could really establish his claim to be the elder son of their grandfather, he must then be the true owner of the old name, all that was left of their possessions, and take his place in the county as Vandaleur of Castle Clare.

Aimlessly she wandered through the blackened ruins of their vanished splendours, wishing she

could remember the house as it had once reared itself amongst the woods. Stephen was not at her side to bring back her wandering thoughts to those better things which life was offering — only old Tomsey Gallon, who awoke her from her dream.

'Av' ye plaze, miss, would you come an' look at the ould black-and-white cabinet?' he said in his soft, sing-song drawl. 'When Joey an' me was just givin' it the least taste in life o' a push back out o' the way the fronts fell out o' it on the flure, an' there's a heap o' wee shinin' things inside in it that we'd be loath to stir until your ladyship sees them.'

She followed the garrulous old man, who talked on and on while he led the way across the flagged court. She was thinking that her own small fortune, with Stephen's consent, would go to swell Myles's income should the worst come to the worst. Stephen had enough. They could live upon very little, life was so simple here in the wilds.

The old cabinet was of Italian workmanship, curiously inlaid with ivory on a dark background. Even to her inexperienced eyes it looked of value. The 'shiny things' of which Tomsey spoke were odds and ends of Indian workmanship, some of them rare and curious. But the only article which Florence carried back to the house herself was an inlaid box of beautiful workmanship which caught her fancy; the rest she directed Tomsey to bring to her at his leisure. After all, suppose things eventuated as they were threatening, these valuable trifles were not hers. They would belong to her grandfather's eldest son.

Myles was not in the house when she laid the little box on the table and proceeded to examine it carefully. It opened with a spring, and apparently was stuffed with soft silk paper of unfamiliar make. Fold after fold of this silky stuff, with its strange, penetrating odour clinging to it after all these years, and then a very beautiful locket, crusted with jewels of almost barbaric splendour. She easily discovered the clasp, and there before her lay a face she knew—Cecil Lavine, with her soft brown eyes, the wealth of lovely hair, the sweet lips parted into a wistful smile. Flames seemed to circle round her. Her heart plunged heavily.

Through the tumult in her brain she heard voices in the hall—her brother's voice and Stephen's. Their half-heard conversation roused her to a sense of the present—of the facts which had to be faced; but they were here in the room with her, and a warm glow spread itself through her being. Here was her Man—the true lover who would shield her through every tempest life might bring. Her very thoughts were incoherent as she made an effort to explain to the two men her discovery of the morning.

Myles saw only one side of the case. 'Had Cecil not come to us we should have remained in utter ignorance of everything,' he said.

She looked at Stephen. He was examining the box and its paper wraps. 'Eustace Vandaleur must have hidden this miniature away in a place where his second wife could never find it,' he said. 'Lady Mildred had probably heard rumours, which doubtless she did not believe. He would not leave anything in her way that could possibly disturb her faith in him. Now, I wonder if there is any inscription on the back of this little thing?' He turned it over and over, probing the case with delicate fingers. He touched a hidden spring; the little picture shot out of its place, revealing three lines of minute writing upon its ivory back. The inscription ran simply: 'Cecille Marie de la Vigny, fille unique de Armand St Louis de la Vigny et Marie de Trepont de Fresnelle, sa femme.'

Myles took the locket from his hand with shining eyes. 'Now there can be no doubt of the old cabinetmaker's story,' he said proudly. 'Eustace Vandaleur's wife came of the old French noblesse.'

'I think that proves the matter beyond question,' Stephen said. 'You understand all that these discoveries involve?'

'Everything,' he returned, with a proud uplift of his head. 'It is only due to her that she should be told at once.'

'But, Myles,' said Florence hesitatingly, 'is there not another side to the question—our side? If her father is our — our uncle, he is rightful owner of all that remains of the Castle Clare estate. Under the Land Acts the old entail rules the money paid into court on the tenant's behalf? It is not ours any more, but his.'

'Even so,' he answered, with that uplifted look in his face which transfigured it; 'even so. We are only the younger branch. It is even possible that our right to our name may be questioned.'

Florence shrank back. 'No—oh no!' she cried.

Stephen threw an arm round her. 'Never that!' he cried. 'Eustace would not have married had he not been certain of his first wife's death.'

'If the son survived, why not the mother?' Myles asked, with that strange light in his eyes. To him, the sacrifice of name and position was sweet. He wished there had been more to lay down at his lady's feet.

Now, Stephen saw things in another light. Nothing could make a change in his love for Florence, but the honour of the family was at stake. 'My dear fellow,' he said in a quiet, matter-of-fact tone, 'much water must go past the mill before Eustace Vandaleur is proved to have committed a criminal act. Even if this

American claimant can make good his story, it will not prove anything to the prejudice of your claim to the old name. Remember, the claim is still to make on his part. We know nothing about him. He may be a spiteful old hunks, or a kindly soul ready to meet you half-way with any proposal you make. It is all in your own hands at present. Suppose you say nothing about these discoveries?'

Myles flamed round upon him; but Florence's light laugh checked the fiery words on his lips. 'We will tell Cecil everything,' she said, 'and wait and see.'

But nothing could be done for a week, because of Mr Lavine's strange attack. Myles waited in a fever of impatience. Through those days he lived in a waking dream. The exultation of sacrifice was upon him; he was ready to lay down all he held most dear, with the certainty of that renunciation being made without hope of reward. He had nothing to offer, while the woman for whose sweet sake he would leave himself bare possessed everything. With her already splendid possessions, she would return to America encircled by a halo of real romance. Had she not been the means of rescuing from oblivion her father's right to a name old as the Anglo-Norman conquest of Ireland, together with those treasures of ancient records such as your modern American dearly loves? What had he to weigh in the balance against all this but the humble love of a mere country clod?

In such a frame of mind they reached Dublin, for Mr Lavine was now convalescent, and would gladly receive them. They were to stay in the same hotel where the old man's illness had overtaken him; in fact, they were to share his suite of rooms.

Cecil met them with eyes that shone sweetly out of a pale face. Myles felt his heart yearn over her as he looked upon her, seeing that she had been shaken by some unwonted experience since last he saw her. The presence of Miss Blinkley in their midst relieved the tension, for the tactful lady talked at large about the city and the everyday topics of the hour. They did not meet Mr Lavine until next day.

Florence was struck at the first glance by the old man's singular likeness to Aunt Jessie, also to the portrait which hung in her room.

His manner of receiving them was cordial and friendly. 'Of course you know that by blood I am your uncle Eustace,' he said as Florence took his hand. 'That is no very startling news to you, my child?'

'No, indeed,' she replied in her gentle voice. 'I only wish we had known it sooner.'

'Ah well, all in good time, my dear,' he answered, as he drew her face down to his and kissed her level brows. 'Amongst my poor mother's papers I found a letter from my father's sister—her name was Jessie—a kind and loving letter. You shall see it some day. I think you must be like her, eh?'

'Aunt Jessie was the sweetest woman that ever lived,' Florence said with tears in her eyes. Then she laid the little miniature in his hand.

The old face flushed up. 'My—my mother—as I never knew her,' he faltered. 'My mother, young and beautiful, and I so old!'

They turned away and left him to himself, not speaking until he called them to him.

'Children,' he said, 'isn't it as if she came back amongst us to tell us we are all of one blood, to tell us we should be friends, and a little more?—Niece Florence, this is the best thing you have brought to me—the very best—because it carries along with it a message of peace.—Now, Nephew Myles, I'm ready to look at those letters and the certificate you mentioned, while I'll relate my side of the story, and show you how the two dovetail into each other.'

But it was Florence who spoke. In fewest words possible she told how she had found the fateful package amongst the ruins of an old writing-desk. She thought it highly probable that her father had not mastered the contents of the letters, as his death had followed close upon the fire. As to Aunt Jessie, she could not tell, but she thought her sense of honour would hinder her from prying into the secrets of the dead. Possibly she heard of the loss of the emigrant ship, and the supposed death of the persons most concerned in the records.

Then the old man spoke. It was quite true, he said, that the ship in which his mother and her boy left London had been wrecked off the Irish coast; but the mother and child had been put ashore a few hours before the catastrophe. A poor, delicate lady, who had fallen in love with the beautiful young exile, had become so terribly ill during the passage down Channel that the ship's doctor said that to continue the voyage would mean death to her. At Kinsale the poor thing, accompanied by 'Mrs Lavine and baby,' were put ashore, as the ship's log, picked up by a passing fisher-boat, proved. This sick lady was a Madame Desmouline, wife of a great manufacturer in St Louis, to which city the trio returned as soon as the lady was able to bear the journey. The Desmoulines were childless, and the worse than orphaned boy became like a son to them after his mother's death. She left a written account of her life and her wrongs, which her son had guarded as a sacred treasure. 'I lived under a false impression of my father until I had children of my own,' the old man said. 'Now, Cecil can tell you the rest.'

She was very pale, knowing all her story involved, and its cost to the man she loved, yet

she related it quietly. Some years ago an old man arrived in St Louis who had once been servant at Castle Clare. He speedily recognised Mr Lavine's remarkable likeness to the family which he so deeply revered, and soon gaining admission to the Desmouline Place, as the great old mansion was called, had his story to tell. A child—but a very sharp child, running almost wild through Castle Clare—he had heard the story of the eldest son whispered to and fro. One day, hidden in the library, and trembling in every limb for sheer terror of his life, he had seen the old man stalk into the room and open the marquetry cabinet, which he cursed with a great oath. Into its most secret recess he thrust a package of letters, saying as he did so, 'You'll end it as you began it. The devil himself couldn't find out your secret if he tried.' He remembered the words well, because that very evening the Bad Vandaleur was carried home dead from the side of Slievebeggan, beyond the lough.

Now, as Eustace's son knew this cabinet had played a very conspicuous part in his mother's story—her manuscript mentioning that it had been through the sale of her mother's cabinet she had first met Eustace Vandaleur—a feverish desire to possess it became a master-passion with her son. The old peasant—who was spending his last years in affluence with a daughter whose husband was one of the heads of a department in the great works—could tell his 'boss' of the downfall of the family at Castle Clare, of the decay of their fortunes, the ruin of their home; and, having all his life believed that his father had been a thorough scoundrel, Eustace Lavine cherished a vision of thrusting out his descendants from the second marriage and taking his place as the real Vandaleur of Castle Clare.

But everything had fallen out in an unexpected fashion. 'I had kept my secret from my daughter,' he said. 'I did not mean her to know anything until the whole truth was made plain. She went upon an errand which she did not understand. Her first surprise was the startling likeness to me which she discovered in a portrait in the room prepared for my agent in the old house. She could not sleep for amazement. Then she was told it was a likeness of her new friend's grandfather, which puzzled her still more. In fact, she wrote a letter, and sent a wire which brought me here. The letter went to St Louis.—Now, Nephew Myles, can't we come to some amicable settlement? Law is a costly thing, and as the property according to your Irish law is strictly entailed upon the male line, you are my heir?'

The young man's face flushed painfully. He kept his eyes upon the ground.

The old man regarded him with an enigmatical smile. 'Take your own time to consider things over,' he said. 'To-morrow is a new day, and you have the best of your lives before you, children, to make or mar. I have lived my life to its utmost limits, and I have gained my heart's desire. If it comes late, it comes time enough for me to know that the name above my head will be Vandaleur of Castle Clare when they lay me in my last home. Go and live your lives, children; mine is well-nigh done.'

Myles scarcely remembers how he passed through that day. He lay sleepless through the night following. He still was Vandaleur, with never a slur upon the name; but for all that he was a broken man, homeless and penniless save for his mother's little fortune. He had strong hands and a resolute heart. The love of a pearl of woman was not for him. How could he ask her to share his broken fortunes? No; there were new countries far away where he could make a fight for success; if he failed there would only be one more nameless grave somewhere overseas. A thought of offering himself as a hand in his uncle's works flashed into his troubled brain, to be instantly banished. No; his future must stand upon its own merits. He would fight the world alone, the last man of his race. By-and-by Cecil would marry some great man, and bring a title into the old family. That thought he also thrust from him. It was more than he could bear.

Daylight brought the need of action. He remembered names of old comrades who had crossed the seas, who were toiling up the hill to ease and competence perhaps, or more likely to the nameless grave which he had foretold for himself in the weary watches of the night. He would go to one of these old friends and try his luck.

The three ladies breakfasted alone.

'Myles has gone out upon business,' Florence said briefly.

And Cecil said—nothing.

They went out into the mild autumnal day, and talked together as girls will, carefully avoiding the subject they both had most at heart. Florence was soon to marry—there was no need of delay—so there were chiffons to be discussed, important trifles in any woman's life.

It was not until, a little tired with shopping, they sat over their tea in the quiet room at the hotel that Cecil said suddenly, 'I had not the slightest idea why my dear father wanted that cabinet. Believe me, had I known the train of circumstances which linked it with your family and mine I never would have touched the matter.'

'But is it not fortunate you did undertake it, Cecil?' Florence said in her tender voice. 'We might never have known you, or perhaps—but it is too dreadful to think—there might be a possibility of our having cause to believe you and your father enemies.'

Cecil made a little deprecating gesture. 'That

never could have been the case. It would be impossible,' she said.

There was silence between them, and Florence thought of Myles. His whole life lay in ruins round him—Myles the dreamer! Poor Myles! and she sighed.

Cecil seemed to divine her thoughts. 'You love your brother,' she said with a little catch in her voice—'love him dearly?'

'He was all I had. We were a lonely pair; and when I go'—— Again she sighed.

'He'—Cecil's face became crimson—'he has not sufficient faith in himself,' she said. 'Tell him I said so.' And they looked at each other intently.

Stephen had arrived. Mr Lavine-Vandaleur had sent for him.

Myles had not yet returned. When he came back there was a curious look in his face, the look of a man who has faced despair. He met his sister in their own room. 'I have been looking round, Flo,' he said, with his arm upon her shoulder. 'I have made arrangements about the horses. She'—he did not name her, but Florence understood that he meant Cecil—'may like to keep Grayling. Tell her I said so. The others I have sold.'

'Dear Myles!' Florence cried, 'what do you mean? Selling the horses! Your precious Grayling! I don't understand. Have you seen Stephen?'

'Stephen will hear soon enough. How can I remain any longer at Castle Clare? It is not mine!' His handsome face had turned gray with pain, and he spoke with an effort. 'I am going to join Harry Western in Canada. I have settled it with his brother Frank. I can get work on their ranch, so I am going.'

'May one ask where, Cousin Myles?' cried a gay voice, as Cecil returned from her father's room. 'Found some new place of interest for us to see? Dublin is full of interesting places.'

'I am going farther,' he returned, averting his face.

'To Killarney? They told us in the hotel that it was rather late in the season for the Lakes; but, if we chance upon fine weather, the place is at its loveliest in autumn.' She was smiling at him, with a sweet, wavering colour in her face, while her eyes shone with a soft radiance which was perfectly entrancing.

He looked away from her. 'I am going much farther,' he said hoarsely. 'To Canada.'

'Canada!' She turned pale. 'But why? What need?' She spoke brokenly.

Florence left them. They were alone in the drawing-room, the life and movement of the great city going on below the wide windows, a golden sunset flaming in the west. 'But why must you go?' she asked, coming just half a step nearer to him. 'Cousin Myles, why must you go?' Tentatively, she extended a hand. 'Why?' she insisted. 'What is the need?'

'Because there is nothing to keep me here,' he said hoarsely, turning away.

'Nothing! How can you say that? You are—you think'—— She was close at his side. 'Nothing in Ireland—not the old place—the old name?' she said.

'It is mine no longer. I have given it up to you with all my heart.' He turned to her, his eyes wild, his face white and drawn. 'I am a ruined man,' he went on. 'I have nothing, can offer nothing. I must go.'

'Not if I ask you to stay, Myles?' she whispered low.

. . . . . .

They are rebuilding the ruined house at Clare Castle. The mine on the mountain-side will soon be in full working order, and the steel-works at St Louis will absorb most of the precious ore it contains. New work, new life, are pouring into the tumble-down little town that straggled along the shore of the lough, dreaming its life away for centuries of inaction. Sometimes Florence Browne thinks she liked it best before the new houses where the miners live were built, and Cecil Vandaleur agrees with her. But then, even prosperity will have its price. The great brain which started all the works is very quiet now, while Myles has no time left for dreaming. Have not all his dreams come true? His horses have carried off blue-ribbons upon every racecourse in the kingdom. The mine is working. In a year or so the castle will stand up in a greater magnificence than ever, and he himself possesses a happiness such as never filled his wildest vision. Is there ever perfect satisfaction under the sun?

Another visionary found his dreams come true—the most improbable dream of all realised to the letter; yet even he could acknowledge that the realisation of the vision was not half so sweet as the mirage that led him through a long and successful life to the resting-place amongst his forefathers and the complete clearing of his mother's name.

Amongst the ruins of St Morgue's Abbey on the promontory over the lough stands a magnificent cross of pure Celtic design, and upon its base the names, 'Eustace Ponsonby Vandaleur, and his wife, Cecille Marie de la Vigny; also, their only son, Eustace de la Vigny Vandaleur of Castle Clare.'

And all the world knows the story of how that Vandaleur of Castle Clare came to his rights at last.

THE SPECIALIST.

By OWEN OLIVER,

AUTHOR OF 'THE LINE,' 'DESTINY,' 'THE BRIDGE WARDEN,' &c.

I HAD only returned to the Home the previous day, after a long and exhausting engagement; but the telegram asked for a nurse who was fond of children and specially competent for operation cases. So the superintendent came to me.

'I know you need a rest, Nan,' she apologised; 'but really there's no one else to send. Will you go?'

'Yes,' I answered, and packed up and travelled all night to Seaness. An open trap met me at the station and took me to Dead Man's Island, which was my destination. The way was over the bed of a salt-river, which was only fordable an hour and a half before and after low-tide, the driver said; and the Hall, where I was going, was the only house of any size upon the island. My little patient owned the whole of it; and Mr Godley, his guardian under the squire's will, 'thought of nothing but a lot of nasty-smelling experiments;' and the boy's stepmother was 'gallivanting about in foreign parts;' and the old housekeeper, who was 'a mother to him,' was ill in bed; and Dr Palmer said they'd better send for a nurse. 'A clever man, Dr Palmer, miss; but—— Well, I don't want you to think I'm set against him, being a teetotaler myself; but you'll see soon enough. And they'll all look to *you* to pull the young master through, if I may speak plain, miss.'

I was depressed by overwork, and these confidences, which I tried vainly to check, did not raise my spirits. The sight of the Hall lowered them further. It looked like a gloomy prison; and Mr Godley the guardian, whom I saw in the library, did not impress me at all favourably. He had a weak mouth and shifty eyes, and was evidently more troubled by the interruption of his experiments than by the illness of his little ward.

'Mrs Fennell will tell you about the case,' he said impatiently. 'I don't see anything wrong with the boy myself, but she keeps worrying about him. It is most inconvenient to be disturbed in my researches at the present moment—most inconvenient. I trust that you will be able to manage without asking me about things.'

'If you will let a servant conduct me to Mrs Fennell,' I said curtly, 'I will not trouble you further.' I never like people who have no affection for children or dogs, and I was glad to get away from him. I fear that I am a somewhat intolerant and headstrong woman.

An amiable but stupid country maid conducted me to the bedroom of the housekeeper, who was utterly prostrated by influenza. I shook up her pillows, and, finding that she had eaten no breakfast, told the maid to bring her some before I talked to her. Then I gave her the medicine, which they had forgotten, and tidied the room; and then I went and sat beside her.

'Now, tell me about it,' I said, putting her gray hair off her forehead.

'You are very good, my dear,' she said feebly. 'I was rather afraid of a hospital nurse; but I see that you will be kind to my little lad. He has no mother.'

'Of course I will,' I promised. 'You will find us great friends when you get up. That will be in a day or two, because I'm going to look after you too. How old is he, and what is the matter with him?'

'He's two next month,' she said, 'and the dearest little fellow that ever was born, and the brightest till this came upon him. Now he lies and stares and says nothing—not even Fen or Ganny Fen, as he used to call me. There's a hard lump at the side of his head; and'—she gulped down something in her throat—'I was always terrified of operations, but I suppose you don't mind them?'

'They're not nearly so dreadful as people think,' I assured her. 'Surgeons are very clever nowadays. They are better at cutting out a "growth" than at curing influenza, for example. *I'm* going to treat you for that. The little fellow's parents are dead, I understand?'

'Yes. His mother died when he was born. I nursed her when she was a baby, and it seemed wrong that she should be taken first and a useless old woman left. Well, well! The squire married again a year after; and six months later *he* died. His second wife was a music-hall actress, and—— I won't say anything against her. She was always kind to the child, and he was wonderfully fond of her. But—well, it's no business of ours, and I think she wasn't bad at heart. The squire left her an income; and if he dies she is to have everything that isn't entailed. That goes to a cousin, a doctor in London. The squire wouldn't trust either

of them with the baby, for fear they'd make away with him. I don't think he was just to her; but as for the cousin, I wouldn't trust him. Anyhow, he left Archie—the blessed lamb!—in charge of Mr Godley, a man with no more human feeling than these bedposts, my dear! I've tried to be a mother to my mistress's child; but now I'm struck down just when—— Oh, my dear! can't you stop them operating on him? But I suppose you think nothing of it.'

'Oh,' I cried, 'don't say that! If I am not present at the operation I generally shut myself up and cry.'

'God bless you, my dear.' She grasped my hand. 'You're a woman, if you *are* a nurse.'

'I hope so,' I agreed. 'But if I *am* at the operation, I won't let my feelings affect my usefulness; and I shall do my very, very best for your little boy. Now, here's your breakfast. Let me prop you up. There! Mary will help you.—I can see that you'll make a good nurse, Mary.—Now, you must eat every scrap of it; and I'll go and see the little chap that I am to mother for you till you are well.'

I have loved many baby-patients, but from the first I loved Archie more than any. He was such a sweet, blue-eyed little fellow, and so wonderfully patient. He did not speak, but he smiled at me faintly, and he held my finger when I took him in my arms. I kissed him and crooned to him while I examined the lump. I was pretty sure that it was cancerous. If so the horrible roots would probably reach to the brain, and the operation would be very dangerous. Poor little smiling baby! I kissed him again.

'Nursie has come to play with Archie,' I said; and he smiled again. I made a little game of washing his face and hands, while Mary, who soon came in, put things in order, under my direction.

Dr Palmer arrived soon after we had finished. He was evidently a heavy drinker, and seemed fuddled even at that early hour, but I judged him to be naturally clever. He pronounced the case very serious, and had telegraphed for a specialist to come down at once; and he had thought it best to have a skilled nurse in case an operation was necessary. Mrs Fennell had insisted that he should also stipulate for one who was fond of children.

'You are used to operations, I suppose?' he asked.

'Yes,' I said. 'Who is the specialist?'

'Dr Royd,' he replied. 'He is an old friend of mine, and quite at the top of his line. Perhaps you know him?'

'Yes,' I said, 'I know him.'

When Dr Palmer had gone I went and broke the news to Mrs Fennell as gently as I could. 'Dr Palmer has sent for a famous specialist,' I told her. 'He is a great surgeon, as well as a great specialist; and he will be able to perform the operation himself at once if it is necessary.'

'You know him?' she inquired.

'Yes,' I answered.

'And you like him?'

'He is very competent,' I said evasively.

'But you do *not* like him?'

'My dislike is purely a personal matter,' I explained. 'He is the doctor whom I should select for the case. I should not have used so strong a term as "dislike" perhaps. We had a disagreement once.'

Sometimes I had thought that the disagreement was my own fault. He had been brusque to me at my first operation, when I almost fainted. Possibly his sharpness saved me, but I resented it the more because I had been anxious to earn his praise. Afterwards, when I had come to be considered a specially good nurse for the operating-room, he told me that he wanted me for his cases; and I told him that I did not wish to take them. He was distinctly rude then, and said that I had no more right to let my objection to him stand in the way of my duty than he had to let his objection to me stand in the way of his. I answered that I could do my duty better with those with whom I liked to work. We had never spoken again, except when he was one of the trio who examined me for the Redman prize, which I won. He was quite fair to me as an examiner, so I tried to do him justice now.

'The disagreement was partly my fault,' I added. 'He is rather overbearing, and I think unsympathetic; but he is certainly very skilful.'

'What is his name?' Mrs Fennell asked.

'Royd,' I told her. 'Paul Royd.'

She gave a sharp cry and clutched my arm. 'Oh,' she cried, 'my little boy! my little boy! He is Archie's cousin. He will kill him. *He is next in the entail!*'

My breath went quickly and came back slowly.

'And he is a friend of Dr Palmer's,' I said; 'but of course he will not operate under the circumstances. I can't think it of him. I won't think it of him. I don't like him, but he is not that sort of man. I am sure of it—*almost* sure of it.'

'Ah!' she cried, '*almost!* You mistrust him in your heart. You think him hard and cruel.'

'Not cruel,' I said. 'Hard—yes. He was hard on me. Still—— Oh, no! He wouldn't do *that*.'

But she persisted that he was not to be trusted. It was written in his face, she declared. He looked like the Evil One (whose appearance she judged from his presentment in *Faust*, I gathered). Dr Royd certainly was of Mephistophelean appearance—tall, thin, dark, and fierce-eyed.

There was another thing against him, it

appeared. He had tried to induce Mr Godley to hand over Archie to his stepmother—'a play-actress, my dear, though I don't say she wasn't good to the child, and wouldn't have hurt him herself; but *he* would have been able to get to him then, being a friend of hers. The squire didn't do as he did for nothing, mark my words.'

I assured her that her suspicions were absurd; and I really believed so, until the afternoon. Then, to our astonishment, Mrs Royd, Archie's stepmother, arrived, having crossed the river by boat. Dr Palmer had written to her, and she had taken the first train from Paris 'to see the little man.' She was not vulgar, but she was gaily dressed, and not innocent of rouge and powder; and I suspected the colour of her hair —a pale gold. She had a stage walk and an exaggerated stage manner. 'Methinks the lady doth protest too much!' I thought when she flung herself on her knees beside Archie's bed.

'What shall mummy play with you, darling dear?' she asked. 'Little precious boy!'

Archie's eyes brightened, and he spoke for once.

'Dump!' he said feebly. 'Dump!'

'Dump!' She laughed a stage laugh. 'Yes, mummy will dance to the lovely one! He always liked her to "dump," didn't he?'

She propped him up on the pillows, and threw off her hat and cloak and danced on the hearth-rug, kicking up her legs and throwing herself into stage attitudes. Whenever she stopped he cried, 'Dump! dump!' And she went on again till she was quite exhausted and sank in a chair.

'Dump, mummy!' he persisted.

'Oh boy!' she said breathlessly, 'mummy's nearly "dumped" to death! I'll sing to sonny-man instead.'

She sang him snatches of music-hall songs, with actions and gestures, till he dozed. Then she gathered up her hat and cloak and looked at me.

'Well,' she said with a shrug, 'you look very properly disgusted, nurse. It's pretty horrible, isn't it, when perhaps to-morrow—— He'll have had an hour's more fun in his little life, anyhow.' She bent suddenly and kissed the small hand that lay upon the counterpane.

'It was very, very kind of you,' I said, 'especially as'——

She turned as if she would strike me. 'As his death would profit me!' she hissed. 'You —you'—— She controlled herself with an evident effort.

'I was going to say as you were evidently very tired,' I protested indignantly; 'but the idea seems to be present in your mind.'

She laughed scornfully. '*Qui s'excuse*,' she said. 'I hope my French is correct. I don't know much. There's a frightful lot that I don't know; but I know people. I know you. You're a good woman—a most horribly good woman! But you're prejudiced and jealous and suspicious. *S'accuse!* That's what you'll always think of me now. Well, *you* don't know people. It was just that—that I hated the thought of profiting by—by—— Oh, little sonny-man!' She kissed the small hand again and swept out with a stage bow.

I sat down and tried to think, and could not make out what I thought; but I took care to leave Mary in the room when I left it to see Mrs Fennell. When I came back Mrs Royd was sitting beside the bed. She was touching the sleeping child's head, and she had been crying. She got up with a forced laugh; but the break in the laugh seemed natural. I believed that my suspicions had been unjust—till Dr Royd came. She met him on the stairs and they talked. The door of the sick-room was ajar, and I was close to it. My ears are very sharp, and I heard what they said, though they spoke softly.

'Paul!' she said, 'my learned doctor!'

I noted the familiarity. I did not hear his reply distinctly, but I thought he called her by her Christian name. They said a few more things in a whisper.

Then she raised her voice a trifle, and I heard again. 'That's how it stands,' she said. 'It's like a stage play! The sick heir, the cruel cousin and the wicked stepmother, the faithful foster-mother and the good nurse who had her suspicions. You've no end of a good nurse!' She laughed sharply.

'Hush!' he told her in his brusque way. 'You've no end of a foolish tongue. Nobody would have had suspicions if you hadn't roused them. Is she a hospital nurse?'

'She's from a nursing institution. She *was* at a hospital—yours! I gather that there's no love lost between you.'

'Who is she?' he asked.

'Her name is Read—Miss E. N. Read.'

'Umph!' he growled. 'Yes, she dislikes me. She's a particularly clever nurse, but cursed with nerves, and as obstinate and prejudiced as—as a woman! If you've put a suspicion into *her* head you'll never put it out, and'——

I could not catch the rest of the conversation, and when he resumed his way upstairs I went over to the bed and took my poor little patient in my arms. I was sitting nursing him and pretending to read when Dr Royd came in.

He was very courteous to me, and went out of his way to express approval of what I had done; and he was more pleasant to Archie than I had ever known him be to a patient. He even gave him his watch to hold to his ear while he examined the swelling. The examination was very brief, and when it was over he patted the child on his head and looked down at him thoughtfully.

'You and I will have to be associated in an operation after all,' he told me quietly.

'When?' I asked, making myself speak quietly too. I had decided to make no protest, but to telegraph to Dr Ferguson, the chairman of the board of my old hospital, to come at once, and to tell him all that I knew.

'To-night,' Dr Royd answered, 'as soon as I can get Palmer over to give the anæsthetic. It is a desperate case, and I fear that I am called in too late. Every hour is important.'

'But he should be dieted first,' I objected. 'And—and you are taking a great responsibility, Dr Royd.'

I looked at him and he looked at me. He turned a little pale, and I saw his hands clench; but he controlled his anger.

'I will not pretend to misunderstand you,' he said very gravely. 'I take that responsibility to give the child his chance—poor as it is. I am aware what you will say afterwards; but I shall have the consent of the boy's guardian, and I shall have the testimony of Dr Palmer.'

'The consent of a man who cares nothing for his poor little ward!' I thought. 'And the testimony of a drunken man, who would do anything for the favour of this great specialist, whom he plumes himself upon knowing! But who would weigh the word of a mere nurse against theirs?'

'You will not take the responsibility of refusing your assistance, I suppose?' Dr Royd asked in a hard voice.

'No,' I said. 'If he dies, God forgive you.'

Dr Royd turned on his heel and left the room. I heard him ask for Mr Godley, and I knew that he had gone to seek permission to perform the operation. I sat hugging the child to me for a time. Then I made up my mind.

Archie had fallen asleep again. I arranged a cloak round him, and then a couple of rugs, which I pinned together carefully. Then I put on my own jacket and hat, and crept down the back-stairs, carrying the child in my arms. I met no one, and got out of the house unseen. It was a cold night, and a strong wind was driving a drizzling rain. There was no light beyond the two lamps at the end of the drive, and the road was barely distinguishable. I trudged on through mud and pools in the road. I walked into several trees and bruised myself, slipped into a shallow trench and injured my ankle, and fell over a heap of stones and cut my face; but I kept the child from harm. At last I reached the little stage at the edge of the river. Two boats were moored there. I got into one, laid the baby on the stern seat, and rowed.

I had very little experience of rowing, and my arms ached after half-a-dozen strokes. To this day I do not know how I got over, but I did. The little pier on the other side was farther up the river, and the tide was flowing in and helped me. If it had been flowing the other way I suppose we should have been driven out to sea and drowned. As it was, the boat almost capsized when I ran it clumsily upon the pier. I snatched up the baby; but another wave caught the boat, and I should have fallen into the water if the old night-watchman had not seized us both and dragged us upon the stage as the boat filled and disappeared. He stood gaping at us in amazement; but I told him that it was a case of life and death, and I was taking my child to the doctor, and then I ran up the pier without waiting for any questions.

I went to the railway station, and found that the night train started in half-an-hour. It was an express to London, and once there I thought that we should be safe. My only fear was that they might track us down before we started. I sat in the waiting-room shivering with apprehension. The station-master noticed my drenched condition, and asked me into his house, where his wife gave me some tea and dried my jacket and the baby's rugs. I told her that I was taking my baby to a hospital, as the doctor said that he must go at once.

At last the train was ready to leave, and I got in. I saw a trap driving up to the station as we were almost out of it. I thought that I recognised Dr Royd's voice calling, and I feared that the train might be stopped at the next station; but it was not, and I went to sleep with the child in my arms. He seemed very ill and slept all the way. He was still asleep when he arrived in London at seven o'clock. I stumbled out upon the platform, cold and nervous and weary. Three people came up to me: Dr Royd, Mrs Royd, and—oh! thank Heaven!—dear old Dr Ferguson. I caught at his arm.

'Oh doctor!' I cried, 'don't listen to *them*. Listen to *me*. I—the baby—he—they'——

'Hush!' he said. 'Hush, my dear! I will listen, but not here. You must come to the hospital. You can hardly stand, poor girl. Give me the baby. You'll trust him with *me*, won't you?'

'Yes,' I cried. 'Yes, yes. I am *very* tired.' The tears rolled down my cheeks. 'We were nearly drowned,' I told him.

'Yes,' he agreed soothingly. 'Yes, dear. *They* might have been killed too.'

He nodded toward Dr Royd and Mrs Royd, and I saw that both were bandaged. I learnt afterwards that they had motored in the dark to Overbury Junction to catch a faster express, by a shorter route, and had had an accident; but they had caught the train in the end, and cut me off. They were determined that the operation should be performed at once, and they had telegraphed to Dr Ferguson to meet us, fearing a scene with me. They thought no doubt that he would take Dr Royd's word against my story; but I thought otherwise.

[*Christmas Number.*

Dr Ferguson took us all to his rooms at the hospital, and had coffee and toast brought in, and made us eat and drink before we talked. Then he asked for my story first, and I told it. Then Dr Royd told his.

Dr Palmer, he said, had been fuddled, as usual, and had written for him, overlooking his relationship to the sick child and his succession to the entail. He had also written to Mrs Royd—'quite properly, Dr Royd said, 'and knowing that the child had no truer friend. Those who really know Mrs Royd,' he added, 'respect and trust her, as I do. It has preyed upon her mind that those who do not understand her should fear to trust her with the little boy whom she loves; and so she said what she said to Miss Read. She is generous enough to own that this gave Miss Read great excuse for suspicion.'

When he arrived she had thought it best to tell him what had passed. This was the conversation that I had heard in part. If I had heard all, he thought that I might have formed a different impression.

When he examined Archie he saw at once that immediate operation was the only hope for the child. Therefore, in spite of the terrible risk to himself, and fully realising the suspicion which would fall upon him if it failed, he decided to perform it; but first he would ask Dr Ferguson to examine the growth. 'I presume,' he said, 'that Miss Read will accept *your* word; and'—he glanced at me for a moment—'I should like to say that although I am deeply hurt at her opinion of me, far more hurt than she suspects, I respect her for the action which she took in consequence of her opinion. She risked her life for the child. I'—his voice was husky—'I do not blame her, but I am very, very hurt and sorry.'

I tried to speak, but could not. Dr Ferguson put on his spectacles, and bent over Archie's swollen face, and I could not speak even then. I should not have spoken, and all my life would have been different, if Mrs Royd—the woman whom I had looked upon as an empty-headed playactress—had not understood and helped me before he delivered his verdict.

'Wait!' she cried. 'Wait! She wants to—to'—— She looked at me, and something in her compassionate eyes seemed to give me strength. I rose and took Archie from Dr Ferguson and put him in Dr Royd's arms.

He did not seem able to speak either for a time, but at last he found words. 'Can you pull yourself together, and help me in the operation?' he asked in his ordinary tone.

I could not speak even then, but I held out my hand with a sob. He pressed it tightly. Then we went into the operating-room. Mrs Royd touched my shoulder as I passed. I turned and kissed her.

You will not wish to hear about the operation, and I do not wish to think about it. It succeeded, and it is still quoted in medical books as a remarkable instance of complete recovery from lesions which might have been expected to impair the mental functions. In Dr Royd's account of the case he gives an undue share of the credit to 'the devoted and wonderfully intelligent nursing of a lady who is a distinguished member of her profession, but prefers that her name should be withheld. The child's affection for and confidence in her gave him sufficient strength and courage to hold to existence during the trying period which followed the operation, and I shall always feel that he owed his life to her.'

Archie had left the hospital and gone to the seaside with Mrs Royd, and I was staying with Mrs Ferguson when I read this. I was very weak and run down, and when she showed me the account I cried as if my heart would break.

'I have never even begged his pardon for what I thought of him,' I told her; 'and I shall never get well till I have. And it's no use just begging his pardon; I want to do something to show him that I mean it. Do you think I might write and tell him that I hope he will let me nurse some of his cases in future?'

'Tell him this afternoon,' she said. 'He is coming to see you. He is very anxious about your health. He says that you are a bundle of nerves.'

'Yes,' I said, 'a bundle of crotchety, disagreeable, suspicious nerves. I hate myself!'

'Oh, well,' she said, '*he* doesn't hate you.'

He came that afternoon, and I began my apology as soon as he entered, but he cut me short.

'I know,' he said; 'I know! You feel that you want to do something to show your confidence in me. That's it, isn't it?'

'Yes,' I said.

He sat down beside the sofa where I was lying—they insisted that I was an invalid—and put his hand on my shoulder.

'And you'd like me to prove my complete confidence in you?' he suggested.

'Yes,' I said. 'I don't deserve it; but I should.'

'Then,' he said, 'will you be my wife, Nan? If you love me, not unless. I trust to your honour not to accept me for any other reason. I love you very much, Nan.'

'I love you too,' I told him; and that was very true. 'You said that I was a good nurse. I hope I shall be a good wife.'

'You will be better as a wife, Nan,' he assured me. 'As a nurse you had one drawback—too much heart. That won't be a drawback now.'

Well, he is a very great specialist. He ought to know.

A NIGHT ADVENTURE IN THE LEVANT.

BY W. F. GRIFFITT BLACKLER, B.A., F.Z.S.

'BUT although my intentions were of the kindest, would I not feel a deep and lasting regret if anything wrong were to befall the ship?'

So I meditated as I paced the terrace one hot July evening, straining my eyes over the blue waters of the bay of Smyrna for some signs of our belated ship, which had been due over a fortnight ago, and by which I was anxiously expecting my brother. He was the Benjamin of the family, and had finished his classical course at Cambridge the previous summer; but my oft-repeated and pressing invitations to come out here and visit the sites of the lost centres of ancient civilisation—the proud citadel of Pergamus, the melancholy grandeur of Ephesus and Laodicea—had at length induced my father to part with the last son that remained with him out of a family of five boys.

It was the summer of 1822, just after the massacres of the Greeks at Chios by the Turks, and the Greek revolution was in full swing. I had been sent out several years previously by my father, one of the most prominent members of the Levant Company, to overlook his interests here in Smyrna. The company had now perhaps passed the zenith of its prosperity, for, although commerce was still brisk, the unfortunate rebellion of the Greeks in their determined fight for freedom was beginning to have a bad effect on business. Nevertheless, the Levant Company practically ruled Smyrna; it appointed its own consuls both here and in the other ports of the Levant, including Alexandria; and the Turks, though fierce and unruly as at all times, were in dread of the power of the hated English Giaour. Just at present, however, affairs were in a very troubled state; and although all the English merchants and their families felt comparatively safe, trusting in their own influence and in the deterrent effect of the three fifty-six-gun frigates then riding at anchor opposite the Pasha's palace, yet deeds of violence were of quite common occurrence, especially after nightfall. The country was infested with marauding bands of bloodthirsty Zeibecs, and pirate vessels roamed the archipelago and frequently attacked schooners and brigs when unarmed or not convoyed.

At length, worn out by anxiety and the heat of the preceding day, I threw myself on my bed in the hopes of sleeping off my disappointment and hearing better news on the morrow. But going to bed and going to sleep are two very different things in this country and at this season. The mosquitoes, with great perseverance, kept up a continuous chorus while they reconnoitred every mesh in the net for a chance of admittance. Now I would wink and feel myself falling into a slumber, when a heartless, villainous little sand-fly, envied by the whole race of lean mosquitoes without, would alight on my nose, and with one little puncture would put the timid Morpheus into headlong flight. After vainly endeavouring to rid myself of my tiny assailant, I suddenly, in a fit of despair, made up my mind to dress and take a walk in the suburbs of the town.

As I have already stated, it was considered to be dangerous to venture out at night alone in these troubled times; but my anxiety and sleeplessness made me throw thoughts of precaution to the winds. So, arming myself with a carefully loaded and primed pistol, and taking a walking-cane which enclosed a stout and serviceable sword-blade, I sallied forth on my nocturnal walk. The twinkling beams of the full moon—though faintly struggling through the openings between the opposite gables, which almost met together—still afforded me light enough to avoid attracting the notice of the packs of hungry mongrels or treading on the unburied remains of some defunct grimalkin, and to pick my way over the rough cobble-stones that paved the road which led out of the town. Soon I left the gabled streets behind me, and, finally emerging from the gloom caused by the long black shadows of the cypresses of the Turkish cemetery, I came out on to the ancient stone caravan bridge, and, pausing at the parapet, looked down on the silvery windings of the Meles.

It was such a night as is common during the summer months in the East: not a cloud to obscure the transparency of the star-studded vault—a blaze of brilliant points of light, not a breath of wind to disturb the tranquillity of the moonlit cypress and olive, and not a sound, save the distant warble of the nightingale and the deep murmur of the river as it glided over its pebbly bed, to break the serene silence that reigned around.

Overcome by emotions that such a scene had

raised within me, I scarcely dared to move lest I should dispel the charm. Then my thoughts instinctively turned towards home and to the happy bygone times over which time had already cast its shadow, and which it were, alas! impossible to live over again. My first arrival in this country and the years I had spent here next passed like a train of dim spectres through my mind, until with a start I came back to the present and recalled to my wandering thoughts the vexatious delay of the ship. Why was I doomed to be disappointed if ever eagerly expecting anything? Had the weather been stormy? Or was there a deeper and more sinister cause for this delay? Pirates! But I scared away the thought as an intruder, and sauntered quietly on again, crossing a field of new-cut corn, and approaching a solitary and uninhabited house standing on the summit of a little knoll.

The upper wooden story, once painted red and projecting considerably beyond the stone walls that supported it, the tiny loopholes, the diminutive windows (that seemed to look with jealousy at the entrance of the light, lest with it should come the gaze of some profane observer), and its ample dimensions all showed at a glance that it had been erected in the days of yore, in even more turbulent times than these, by some wealthy Turk who looked as much to safety as to grandeur. But though the place had evidently outlived several generations of owners, it now stood deserted, and its crazy-looking shutters, its door nearly off its hinges, its generally dilapidated state, and its gaunt and weird appearance made it seem to be just the sort of place that a ghost would choose for its earthly habitation if it should ever have a wish to revisit the scenes of its material childhood. Indeed, the place had the reputation of being haunted by the shade of a Turkish woman who had been brutally done to death by a jealous and cold-blooded husband, and the natives could under no circumstances be persuaded to venture near its vicinity after dusk. Stories were current of strange and weird noises that had been heard to emanate from this house during the witching hour of night. Amongst the many supernatural noises that had alarmed the credulous, what had perhaps excited the greatest amount of talk and speculation was an occasional sound heard during the night like the thumping of a monster pestle against a mortar. This was at last, at the suggestion of the baker of the district, set down as 'being occasioned by the spirit of a Turk, who, being stinted during his lifetime in the national beverage, could not at times resist the temptation of stealing away from the Seventh Heaven to have a spell at pounding the berry and cooking the coffee for which he had so great a partiality.'

Yet, in the face of these and other facts as well authenticated, I was incredulous, and could admire without trepidation the romantic and somewhat fantastic appearance which the ruined house presented under the pale, cold light of the moon. My imagination carried me back to remote times, and I paused, picturing to myself how the old place must have looked under its feudal masters. What tales would not these old walls unfold, if they but had the power, of carousals and wassail that had caused them to reverberate, of fierce fights and dark deeds that they had silently looked down upon!

Suddenly my reverie was rudely interrupted by the noise of footsteps within the house, followed by the sound of voices as of men in eager conversation. Whatever feelings of awe the former had raised the latter equally rapidly dispelled; for spirits, although accused of a thousand and one misdemeanours, had never as yet the power of speech assigned to them, still less the power of holding conversations among themselves. My curiosity being aroused, I determined to follow my adventure to the end, and, if possible, to discover whether the awe-inspiring noises heard at times were perhaps caused by 'spirits' of a very material kind. I carefully crept nearer and nearer to the house, and hid in the shadow of a mass of ruined masonry. As I listened the voices became more audible; the speakers were evidently coming out of the house. I strained my ears to catch what was being said, and heard the words, 'I, too, should not care to shed the blood of a defenceless youth; but it is in self-defence. Our place of refuge would be known were we to let him go.'

I felt a cold shiver run down my back. Had these men, whoever they were, seen me approaching their lair, and now completely cut off every means of escape, intending to punish my inquisitiveness? I carefully drew out my pistol, resolved to make a dash for liberty, when the next words that were wafted to my ears dispelled all the fears of discovery I had entertained. 'Well, then, there is no time to be lost; the boat must leave soon. Let us go and call the others.—You, Pseftadoni, remain here and watch the boy till we return. —Come along!'

Two dark forms left the house and walked rapidly down the hill in the direction of the shore. An irresistible impulse urged me to enter the house and try to solve this mystery. I crawled up to the doorway and listened attentively. Not a sound save the distant, melancholy hoot of an owl in the cypresses of the cemetery broke the stillness that reigned around; so, carefully pushing open the half-closed door, I entered this house of such ghostly repute, and found myself in a spacious marble-floored hall, which looked, by the few rays of moonlight that filtered in through the dust-begrimed windows, most dismal and awesome in its decayed grandeur. The rooms on either

side seemed to be quite empty, so I carefully tiptoed my way towards a rickety-looking staircase at the farther end of the hall. I paused here for an instant, and my heart gave a sudden start as I distinctly heard a sound as of some one clearing his throat in one of the rooms above.

My curiosity, stifling all thoughts of precaution, impelled me onwards to follow out this mysterious adventure which seemed at every step to become more and more interesting. I immediately made up my mind to search the rooms above. Noiselessly stealing up the creaking steps, I breathed a sigh of relief when I at last stood at the head of the staircase, my presence as yet apparently unrevealed to the person who had betrayed his presence a few minutes before. A shaft of light coming from a half-closed door at the farther end of the hall attracted my attention, so I breathlessly crept towards it and peeped in. At a table in the middle of the room, on which stood a sputtering candle, sprawled a man dressed as a Greek islander, evidently fast asleep, with a half-empty bottle and a drawn yataghan at his elbow. But my eyes, wandering on beyond him, beheld a second figure crouching on a heap of straw in the farther corner, with its hands pinioned behind its back; and, even as I looked—oh, horror!—the figure turned a pale and haggard face towards me, and the face was that of my long-expected brother!

In an instant my plan was formed; and, bursting into the room, I applied the muzzle of my pistol to the temple of the old pirate, a poser he had no heart nor wish to contend against; and, hastily disarming him, I was at my brother's side, and in a second more he stood up free. Seizing him by the arm and dragging him to the door, I turned the key on the Greek, and we cleared the stairs in a trice. It was too late! More than a dozen armed men rushed upon us before we could leave the house; in a twinkling I was set upon and borne to the ground. I struggled to get the pistol which had been forced from my grasp in the first encounter. I tried to cry out, but my voice failed me, my eyes grew dim, everything seemed to vanish away, and, starting up—I awoke!

It was broad daylight, and my servant, having received no answer to his repeated knocks at my door, had at length forced it open, and almost dragged me from my bed in his rude efforts to recall me from the land of dreams. I was about to give him a sound rating, if not something more compatible with his understanding, when my eye, travelling through the open door, caught sight of a heap of luggage in the hall; and the next instant, leaping out of bed, I was clasped in the arms of my long and anxiously expected brother, who had safely arrived at last in the early hours of the morning.

RESURGENT.

ROUND towering pines the sombre shadows crouch,
The moonlight silvers the datura bells,
Where in the magic of the scented night
She weaves in silence her mysterious spells.

The stalwart trees, strong with the strength of years,
Triumphantly defy Time's ceaseless flight,
And cast their shadow over dreaming flowers,
Sleeping in patience through the winter night.

Till flushed as dawn the mustering cohorts rise
Through the bare earth to answer to their names,
Or steal at spring's loud, joyous clarion-call,
Gorgeous as sunset's cardinal-red flames.

Only a few brief weeks of rest and dreams,
And barren earth her hidden treasure yields;
While maids sleep on, deaf to the clamour wild,
And gallant boys on hard-fought battlefields.

For, lo! the winter past, the rain-clouds gone,
Spring's resurrection sounds the appointed hours,
And flowering worlds respond to life's glad call—
But Souls need longer rest than wearied flowers.
